Package: rqti (via r-universe)

October 11, 2024

Title Create Tests According to QTI 2.1 Standard

Version 0.3.0.9000

Description Create tests and tasks compliant with the Question & Test Interoperability (QTI) information model version 2.1. Input sources are Rmd/md description files or S4-class objects. Output formats include standalone zip or xml files. Supports the generation of basic task types (single and multiple choice, order, pair association, matching tables, filling gaps and essay) and provides a comprehensive set of attributes for customizing tests.

License GPL (>= 3)

Encoding UTF-8

AssessmentItem-class Class AssessmentItem

Description

Abstract class AssessmentItem is responsible for creating a root element 'assessmentItem' in XML task description according to QTI 2.1. This class is not meant to be instantiated directly; instead, it serves as a base for derived classes.

Slots

- identifier A character representing the unique identifier of the assessment task. By default, it is generated as 'id_task_dddd', where dddd represents random digits.
- title A character representing the title of the XML file associated with the task. By default, it takes the value of the identifier.
- content A list of character content to form the text of the question, which can include HTML tags. For tasks of the Entry type, it must also contain at least one instance of Gap objects, such as TextGap, TextGapOpal, NumericGap, or InlineChoice.

- prompt An optional character representing a simple question text, consisting of one paragraph. This can supplement or replace content in the task. Default is "".
- points A numeric value, optional, representing the number of points for the entire task. Default is 1, but pay attention:
 - For tasks of the Entry type, it is calculated as the sum of the gap points by default.
 - For tasks of the DirectedPair, the default is calculated as 0.5 points per pair.
 - For tasks of the MatchTable type, it can also be calculated as the sum of points for individual answers, when provided.
 - For tasks of the MultipleChoice type, points is numeric vector and required. Each number in this vector determines the number of points that will be awarded to a candidate if they select the corresponding answer. The order of the scores must match the order of the choices. It is possible to assign negative values to incorrect answers. All answers with a positive score are considered correct.
- feedback A list containing feedback messages for candidates. Each element of the list should be an instance of either ModalFeedback, CorrectFeedback, or WrongFeedback class.
- calculator A character, optional, determining whether to show a calculator to the candidate. Possible values:
 - "simple"
 - "scientific"
- files A character vector, optional, containing paths to files that will be accessible to the candidate during the test/exam.

metadata An object of class QtiMetadata that holds metadata information about the task.

assessmentSection Create an object AssessmentSection

Description

Create an AssessmentSection rqti-object as part of a test content

```
assessmentSection(
  assessment_item,
  identifier = generate_id(type = "section"),
  title = identifier,
  selection = NA_integer_,
  time_limit = NA_integer_,
  visible = TRUE,
  shuffle = FALSE,
  max_attempts = NA_integer_,
  allow_comment = TRUE
)
```

Arguments

assessment_ite	m
	A list containing AssessmentSection and/or Assessment item objects, such as SingleChoice, MultipleChoice, Essay, Entry, Ordering, OneInRowTable, OneIn-ColTable, MultipleChoiceTable, and DirectedPair.
identifier	A character value indicating the identifier of the test file. By default, it is gener- ated as 'id_section_dddd', where dddd represents random digits.
title	A character value, optional, representing the file title. By default, it takes the value of the identifier.
selection	An integer value, optional, defining how many children of the section are delivered in the test. Default is NA_integer_, meaning "no selection".
time_limit	An integer value, optional, controlling the amount of time in munutes a candi- date is allowed for this part of the test.
visible	A boolean value, optional, indicating whether the title of this section is shown in the hierarchy of the test structure. Default is TRUE.
shuffle	A boolean value, optional, responsible for randomizing the order in which the assessment items and subsections are initially presented to the candidate. Default is FALSE.
<pre>max_attempts</pre>	An integer value, optional, enabling the maximum number of attempts allowed for a candidate to pass this section.
allow_comment	A boolean value, optional, enabling candidates to leave comments on each ques- tion of the section. Default is TRUE.

Value

An object of class AssessmentSection.

See Also

section(), test(), test4opal()

Examples

```
sc <- singleChoice(prompt = "Question", choices = c("A", "B", "C"))
es <- essay(prompt = "Question")
# Since ready-made S4 "AssessmentItem" objects are taken, in this example a
#permanent section consisting of two tasks is created.
s <- assessmentSection(list(sc, es), title = "Section with nonrandomized tasks")</pre>
```

AssessmentSection-class

Class "AssessmentSection"

Description

Class AssessmentSection is responsible for forming a section in the test XML specification according to QTI 2.1.

Slots

- identifier A character representing the unique identifier of the assessment section. By default, it is generated as 'id_section_dddd', where dddd represents random digits.
- title A character representing the title of the section in the test. By default, it takes the value of the identifier.
- time_limit A numeric value, optional, controlling the amount of time *in munutes* a candidate is allowed for this part of the test.
- visible A boolean value, optional. If TRUE, it shows this section in the hierarchy of the test structure. Default is TRUE.
- assessment_item A list containing AssessmentSection and/or Assessment item objects, such as SingleChoice, MultipleChoice, Essay, Entry, Ordering, OneInRowTable, OneInColTable, MultipleChoiceTable, and DirectedPair.
- shuffle A boolean value, optional, responsible for randomizing the order in which the assessment items and subsections are initially presented to the candidate. Default is FALSE.
- selection A numeric value, optional, defining how many children of the section are delivered in the test.
- max_attempts A numeric value, optional, enabling the maximum number of attempts a candidate is allowed to pass in this section.
- allow_comment A boolean value, optional, enabling to allow the candidate to leave comments in each question of the section. Default is TRUE.

See Also

section(), test(), test4opal(), AssessmentTest, AssessmentTestOpal.

Examples

```
title = "Section",
time_limit = 20,
visible = FALSE,
assessment_item = list(sc1, sc2, sc3),
shuffle = FALSE,
selection = 1,
max_attempts = 1,
allow_comment = FALSE)
```

assessmentTest

Create an object AssessmentTest

Description

Create an AssessmentTest rqti-object.

Usage

```
assessmentTest(
  section,
  identifier = generate_id(type = "test"),
  title = identifier,
  time_limit = 90L,
 max_attempts = 1L,
  academic_grading = FALSE,
  grade_label = c(en = "Grade", de = "Note"),
  table_label = c(en = "Grade", de = "Note"),
  navigation_mode = "nonlinear",
  submission_mode = "individual",
  allow_comment = TRUE,
  rebuild_variables = TRUE,
 metadata = qti_metadata(),
  points = NA_real_
)
```

Arguments

section	A list containing AssessmentSection objects.
identifier	A character value indicating the identifier of the test file. By default, it is gener- ated as 'id_test_dddd', where dddd represents random digits.
title	A character value, optional, representing the file title. By default, it takes the value of the identifier.
time_limit	An integer value, optional, controlling the time given to a candidate for the test in minutes. Default is 90 minutes.
<pre>max_attempts</pre>	An integer value, optional, indicating the maximum number of attempts allowed for the candidate. Default is 1.

academic_grading		
	A boolean, optional; enables showing a grade to the candidate at the end of the testing according to the 5-point academic grade system as feedback. Default is FALSE.	
grade_label	A character value, optional; a short message that shows with a grade in the final feedback; for multilingual use, it can be a named vector with two-letter ISO language codes as names (e.g., c(en="Grade", de="Note")); during test creation, it takes the value for the language of the operating system; c(en="Grade", de="Note") is default.	
table_label	A character value, optional; a concise message to display as the column ti- tle of the grading table in the final feedback; for multilingual use, it can be a named vector with two-letter ISO language codes as names (e.g., c(en="Grade", de="Note")); during test creation, it takes the value for the language of the op- erating system; c(en="Grade", de="Note")is default.	
navigation_mode		
	A character value, optional, determining the general paths that the candidate may have during the exam. Two mode options are possible: - 'linear': Candidate is not allowed to return to previous questions 'nonlinear': Candidate is free to navigate; used by default.	
submission_mode		
	A character value, optional, determining when the candidate's responses are submitted for response processing. One of two mode options is possible: - 'individual': Submit candidates' responses on an item-by-item basis; used by default 'simultaneous': Candidates' responses are submitted all together by the end of the test.	
allow_comment	A boolean, optional, enabling the candidate to leave comments in each question. Default is TRUE.	
rebuild_variables		
	A boolean, optional, enabling the recalculation of variables and reshuffling the order of choices for each item-attempt. Default is TRUE.	
metadata	An object of class QtiMetadata that holds metadata information about the test. By default it creates QtiMetadata object. See qti_metadata().	
points	Do not use directly; the maximum number of points for the exam/test. It is calculated automatically as a sum of points of included tasks.	

Value

An AssessmentTest object.

See Also

test(), test4opal(), section(), AssessmentTest, AssessmentSection

Examples

```
sc <- sc <- singleChoice(prompt = "Question", choices = c("A", "B", "C"))
es <- new("Essay", prompt = "Question")
s <- section(c(sc, es), title = "Section with nonrandomized tasks")</pre>
```

```
t <- assessmentTest(list(s), title = "Example of the Exam")</pre>
```

AssessmentTest-class Class "AssessmentTest"

Description

Class AssessmentTest is responsible for creating XML exam files according to the QTI 2.1 standard.

Details

Test consists of one or more sections. Each section can have one or more questions/tasks and/or one or more sub sections.

Slots

- identifier A character representing the unique identifier of the assessment test. By default, it is generated as 'id_test_dddd', where dddd represents random digits.
- title A character representing the title of the test. By default, it takes the value of the identifier.
- points Do not use directly; the maximum number of points for the exam/test. It is calculated automatically as a sum of points of included tasks.

test_part_identifier A character representing the identifier of the test part.

- navigation_mode A character value, optional, determining the general paths that the candidate may have during the exam. Possible values:
 - "linear" candidate is not allowed to return to the previous questions.
 - "nonlinear" candidate is free to navigate. This is used by default.
- submission_mode A character value, optional, determining when the candidate's responses are submitted for response processing. Possible values:
 - "individual" submit candidates' responses on an item-by-item basis. This is used by default.
 - "simultaneous" candidates' responses are submitted all together by the end of the test.

section A list containing one or more AssessmentSection objects.

- time_limit A numeric value, optional, controlling the amount of time in minutes which a candidate is allowed for this part of the test.
- max_attempts A numeric value, optional, enabling the maximum number of attempts that a candidate is allowed to pass.
- allow_comment A boolean value, optional, enabling to allow candidates to leave comments in each question.
- rebuild_variables A boolean value, optional, enabling to recalculate variables and reshuffle the order of choices for each item-attempt.

10

- academic_grading A boolean value, optional, enabling to show to candidates at the end of the testing a grade according to a 5-point academic grade system as feedback. Default is FALSE.
- grade_label A character value, optional, representing a short message to display with a grade in the final feedback. For multilingual usage, it hat to be a named vector with two-letter ISO language codes as names (e.g., c(en="Grade", de="Note")); during test creation, it takes the value for the language of the operating system. Default is c(en="Grade", de="Note").
- table_label A character value, optional, representing a concise message to display as the column title of the grading table in the final feedback. For multilingual usage, it hat to be a named vector with two-letter ISO language codes as names (e.g., c(en="Grade", de="Note")); during test creation, it takes the value for the language of the operating system. Default is c(en="Grade", de="Note").

metadata An object of class QtiMetadata that holds metadata information about the test.

See Also

AssessmentSection, AssessmentTestOpal, test(), test4opal(), section().

Examples

```
# This example creates test 'exam' with one section 'exam_section' which
# consists of two questions/tasks: essay and single choice types
task1 <- new("Essay", prompt = "Test task", title = "Essay",</pre>
             identifier = "q1")
task2 <- new("SingleChoice", prompt = "Test task", title = "SingleChoice",</pre>
             choices = c("A", "B", "C"), identifier = "q2")
exam_section <- new("AssessmentSection", identifier = "sec_id",</pre>
                    title = "section", assessment_item = list(task1, task2))
exam <- new("AssessmentTest",</pre>
            identifier = "id_test_1234",
            title = "Example of Exam",
            navigation_mode = "linear",
            submission_mode = "individual",
            section = list(exam_section),
            time_limit = 90,
            max_attempts = 1,
            academic_grading = TRUE,
            grade_label = "Preliminary grade")
```

assessmentTestOpal Create an object AssessmentTestOpal

Description

Create an AssessmentTestOpal rqti-object.

Usage

```
assessmentTestOpal(
  section,
  identifier = generate_id(type = "test"),
  title = identifier,
  time_limit = 90L,
 max_attempts = 1L,
  academic_grading = FALSE,
  grade_label = c(en = "Grade", de = "Note"),
  table_label = c(en = "Grade", de = "Note"),
  navigation_mode = "nonlinear",
  submission_mode = "individual",
  allow_comment = TRUE,
  rebuild_variables = TRUE,
  show_test_time = TRUE,
  calculator = NA_character_,
 mark_items = TRUE,
 keep_responses = FALSE,
 metadata = qti_metadata(),
 points = NA_real_
)
```

Arguments

section	A list containing AssessmentSection objects.
identifier	A character value indicating the identifier of the test file. By default, it is generated as 'id_test_dddd', where dddd represents random digits.
title	A character value, optional, representing the file title. By default, it takes the value of the identifier.
time_limit	An integer value, optional, controlling the time given to a candidate for the test in minutes. Default is 90 minutes.
<pre>max_attempts</pre>	An integer value, optional, indicating the maximum number of attempts allowed for the candidate. Default is 1.
academic_gradin	g
	A boolean, optional; enables showing a grade to the candidate at the end of the testing according to the 5-point academic grade system as feedback. Default is FALSE.
grade_label	A character value, optional; a short message that shows with a grade in the final feedback; for multilingual use, it can be a named vector with two-letter ISO language codes as names (e.g., c(en="Grade", de="Note")); during test creation, it takes the value for the language of the operating system; c(en="Grade", de="Note") is default.
table_label	A character value, optional; a concise message to display as the column ti- tle of the grading table in the final feedback; for multilingual use, it can be a named vector with two-letter ISO language codes as names (e.g., c(en="Grade", de="Note")); during test creation, it takes the value for the language of the op- erating system; c(en="Grade", de="Note")is default.

12

navigation_mode	
	A character value, optional, determining the general paths that the candidate may have during the exam. Two mode options are possible: - 'linear': Candidate is not allowed to return to previous questions 'nonlinear': Candidate is free to navigate; used by default.
submission_mode	
	A character value, optional, determining when the candidate's responses are submitted for response processing. One of two mode options is possible: - 'individual': Submit candidates' responses on an item-by-item basis; used by default 'simultaneous': Candidates' responses are submitted all together by the end of the test.
allow_comment	A boolean, optional, enabling the candidate to leave comments in each question. Default is TRUE.
rebuild_variabl	es
	A boolean, optional, enabling the recalculation of variables and reshuffling the order of choices for each item-attempt. Default is TRUE.
<pre>show_test_time</pre>	A boolean, optional, determining whether to show candidate elapsed processing time without a time limit. Default is TRUE.
calculator	A character value, optional, determining whether to show a calculator to the candidate. Possible values: - "simple" - "scientific".
mark_items	A boolean, optional, determining whether to allow candidate marking of questions. Default is TRUE.
keep_responses	A boolean, optional, determining whether to save the candidate's answers from the previous attempt. Default is FALSE.
metadata	An object of class QtiMetadata that holds metadata information about the test. By default it creates QtiMetadata object. See qti_metadata().
points	Do not use directly; the maximum number of points for the exam/test. It is calculated automatically as a sum of points of included tasks.

Value

An AssessmentTestOpal object.

See Also

test(), test4opal(), section(), assessmentTest(), AssessmentTest, AssessmentSection

Examples

```
sc <- sc <- singleChoice(prompt = "Question", choices = c("A", "B", "C"))
es <- new("Essay", prompt = "Question")
s <- section(c(sc, es), title = "Section with nonrandomized tasks")
t <- assessmentTest(list(s), title = "Example of the Exam")</pre>
```

AssessmentTestOpal-class

Class "AssessmentTestOpal"

Description

Class AssessmentTestOpal is responsible for creating XML exam files according to the QTI 2.1 standard for LMS Opal.

Details

Test consists of one or more sections. Each section can have one or more questions/tasks and/or one or more sub sections.

Slots

- identifier A character representing the unique identifier of the assessment test. By default, it is generated as 'id_test_dddd', where dddd represents random digits.
- title A character representing the title of the test. By default, it takes the value of the identifier.
- points Do not use directly; the maximum number of points for the exam/test. It is calculated automatically as a sum of points of included tasks.
- test_part_identifier A character representing the identifier of the test part.
- navigation_mode A character value, optional, determining the general paths that the candidate may have during the exam. Possible values:
 - "linear" candidate is not allowed to return to the previous questions.
 - "nonlinear" candidate is free to navigate. This is used by default.
- submission_mode A character value, optional, determining when the candidate's responses are submitted for response processing. Possible values:
 - "individual" submit candidates' responses on an item-by-item basis. This is used by default.
 - "simultaneous" candidates' responses are submitted all together by the end of the test.
- section A list containing one or more AssessmentSection objects.
- time_limit A numeric value, optional, controlling the amount of time in minutes which a candidate is allowed for this part of the test.
- max_attempts A numeric value, optional, enabling the maximum number of attempts that a candidate is allowed to pass.
- allow_comment A boolean value, optional, enabling to allow candidates to leave comments in each question.
- rebuild_variables A boolean value, optional, enabling to recalculate variables and reshuffle the order of choices for each item-attempt.
- academic_grading A boolean value, optional, enabling to show to candidates at the end of the testing a grade according to a 5-point academic grade system as feedback. Default is FALSE.

- grade_label A character value, optional, representing a short message to display with a grade in the final feedback. For multilingual usage, it hat to be a named vector with two-letter ISO language codes as names (e.g., c(en="Grade", de="Note")); during test creation, it takes the value for the language of the operating system. Default is c(en="Grade", de="Note").
- table_label A character value, optional, representing a concise message to display as the column title of the grading table in the final feedback. For multilingual usage, it hat to be a named vector with two-letter ISO language codes as names (e.g., c(en="Grade", de="Note")); during test creation, it takes the value for the language of the operating system. Default is c(en="Grade", de="Note").
- metadata An object of class QtiMetadata that holds metadata information about the test.
- show_test_time A boolean value, optional, determining whether to show the candidate elapsed
 processing time without time limit. Default is FALSE.
- calculator A character value, optional, determining whether to show a calculator to the candidate. Possible values:
 - "simple"
 - "scientific".
- mark_items A boolean value, optional, determining whether to allow candidate marking of questions. Default is TRUE.
- keep_responses A boolean value, optional, determining whether to save candidate's answers from the previous attempt. Default is FALSE.
- files A character vector, optional, containing paths to files that will be accessible to the candidate during the test/exam.

Examples

```
# This example creates test 'exam' with one section 'exam_section' which
# consists of two questions/tasks: essay and single choice types
task1 <- new("Essay", prompt = "Test task", title = "Essay",</pre>
             identifier = "q1")
task2 <- new("SingleChoice", prompt = "Test task", title = "SingleChoice",</pre>
             choices = c("A", "B", "C"), identifier = "q2")
exam_section <- new("AssessmentSection", identifier = "sec_id",</pre>
                     title = "section", assessment_item = list(task1, task2))
exam <- new("AssessmentTestOpal",</pre>
            identifier = "id_test_1234",
            title = "Example of Exam",
            navigation_mode = "linear",
            submission_mode = "individual",
            section = list(exam_section),
            time_limit = 90,
            max_attempts = 1,
            academic_grading = TRUE,
            grade_label = "Preliminary grade",
            show_test_time = TRUE,
```

```
calculator = "scientific-calculator",
mark_items = TRUE,
files = "text_book.pdf")
```

authLMS

Authenticate with LMS

Description

A generic function to handle authentication with a Learning Management System (LMS).

A generic function to handle authentication with LMS Opal.

Usage

```
authLMS(object, ...)
## S4 method for signature 'Opal'
authLMS(object, ...)
```

Arguments

object	an instance of the S4 object Opal
	Additional arguments to be passed to the method, if applicable.

```
buildAssessmentSection
```

Build tags for AssessmentSection in assessmentTest

Description

Generic function for tags that contains assessementSection in assessnetTest

```
buildAssessmentSection(object, folder = NULL, verify = FALSE)
## S4 method for signature 'AssessmentItem'
buildAssessmentSection(object, folder)
## S4 method for signature 'AssessmentSection'
buildAssessmentSection(object, folder = NULL, verify = FALSE)
## S4 method for signature 'character'
buildAssessmentSection(object, folder = NULL, verify = FALSE)
```

Choice-class

Arguments

object	an instance of the S4 object (AssessmentSection and all types of Assessmen- tItem)
folder	string; a folder to store xml file
verify	boolean, optional; check validity of xml file, default FALSE

Choice-class

Class "Choice"

Description

Abstract class Choice is not meant to be instantiated directly; instead, it serves as a base for derived classes SingleChoice and MultipleChoice.

Slots

choices A character vector defining a set of answer options in the question.

- choice_identifiers A character vector, optional, containing a set of identifiers for answers. By default, identifiers are generated automatically according to the template "ChoiceD", where D is a letter representing the alphabetical order of the answer in the list.
- shuffle A boolean value indicating whether to randomize the order in which the choices are initially presented to the candidate. Default is TRUE.
- orientation A character, determining whether to place answers in vertical or horizontal mode. Possible values:
 - "vertical" Default.
 - "horizontal"

correctFeedback Create object CorrectFeedback

Description

Create object CorrectFeedback

Usage

```
correctFeedback(content = list(), title = character(0), show = TRUE)
```

Arguments

content	A character string or a list of character strings to form the text of the question, which may include HTML tags.
title	A character value, optional, representing the title of the feedback window.
show	A boolean value, optional, determining whether to show (TRUE) or hide (FALSE) the feedback. Default is TRUE.

Value

An object of class CorrectFeedback

Examples

```
cfb <- correctFeedback(content = "Some comments", title = "Feedback")</pre>
```

CorrectFeedback-class Class "CorrectFeedback"

Description

Class CorrectFeedback is responsible for delivering feedback messages to the candidate in case of a correct answer on the entire exercise.

Slots

- outcome_identifier A character representing the unique identifier of the outcome declaration variable that relates to feedback. Default is "FEEDBACKMODAL".
- show A boolean value, optional, determining whether to show (TRUE) or hide (FALSE) the modal feedback. Default is TRUE.
- title A character value, optional, representing the title of the modal feedback window.
- content A list of character content to form the text of the modal feedback, which can include HTML tags.
- identifier A character value representing the identifier of the modal feedback item. Default is "correct". cfb <- new("CorrectFeedback", title = "Right answer", content = list("Some demonstration"))

createAssessmentTest Create an element assessmentTest of a qti-xml document for test

Description

Generic function for creating assessmentTest element for XML document of specification the test following the QTI schema v2.1

```
createAssessmentTest(object, folder, verify = FALSE)
## S4 method for signature 'AssessmentTest'
createAssessmentTest(object, folder, verify = FALSE)
## S4 method for signature 'AssessmentTestOpal'
createAssessmentTest(object, folder, verify = FALSE)
```

createItemBody

Arguments

object	an instance of the S4 object AssessmentTest or AssessmentTestOpal
folder	string, optional; a folder to store xml file; working directory by default
verify	boolean, optional; to check validity of xml file, default FALSE

createItemBody	Create an element itemBody of a qti-xml document
----------------	--

Description

Generic function for creating itemBody element for XML document of specification the question following the QTI schema v2.1

```
createItemBody(object)
## S4 method for signature 'DirectedPair'
createItemBody(object)
## S4 method for signature 'Entry'
createItemBody(object)
## S4 method for signature 'Essay'
createItemBody(object)
## S4 method for signature 'MultipleChoice'
createItemBody(object)
## S4 method for signature 'MultipleChoiceTable'
createItemBody(object)
## S4 method for signature 'OneInColTable'
createItemBody(object)
## S4 method for signature 'OneInRowTable'
createItemBody(object)
## S4 method for signature 'Ordering'
createItemBody(object)
## S4 method for signature 'SingleChoice'
createItemBody(object)
```

Arguments

object

an instance of the S4 object (SingleChoice, MultipleChoice, Essay, Entry, Ordering, OneInRowTable, OneInColTable, MultipleChoiceTable, DirectedPair)

createMetadata Create an element of metadata

Description

Create an element of metadata

Usage

createMetadata(object)

S4 method for signature 'QtiContributor'
createMetadata(object)

S4 method for signature 'AssessmentItem'
createMetadata(object)

S4 method for signature 'AssessmentTest'
createMetadata(object)

Arguments

object an instance of the S4 object (QtiContributor, QtiMetadata

createOutcomeDeclaration

Create an element outcomeDeclaration of a qti-xml document

Description

Generic function for creating outcomeDeclaration element for XML document of specification the question following the QTI schema v2.1

Usage

```
createOutcomeDeclaration(object)
```

S4 method for signature 'AssessmentItem'
createOutcomeDeclaration(object)

S4 method for signature 'AssessmentTest'

```
createOutcomeDeclaration(object)
## S4 method for signature 'Entry'
createOutcomeDeclaration(object)
## S4 method for signature 'Gap'
createOutcomeDeclaration(object)
```

Arguments

object an instance of the S4 object (SingleChoice, MultipleChoice, Essay, Entry, Ordering, OneInRowTable, OneInColTable, MultipleChoiceTable, DirectedPair, TextGap, NumericGap, InlineChoice)

createQtiTask-methods Create XML or zip file for question specification

Description

Create XML or zip file for question specification

Usage

```
createQtiTask(object, dir = ".", verification = FALSE, zip = FALSE)
## S4 method for signature 'AssessmentItem'
createQtiTask(object, dir = ".", verification = FALSE, zip = FALSE)
```

Arguments

object	An instance of the S4 object (SingleChoice, MultipleChoice, Essay, Entry, Or- dering, OneInRowTable, OneInColTable, MultipleChoiceTable, DirectedPair).
dir	A character value, optional; a folder to store xml file; working directory is used by default.
verification	A boolean value, optional; to check validity of xml file. Default is FALSE.
zip	A boolean value, optional; the TRUE value allows to create a zip archive with the manifest and task files inside. Default is FALSE.

Value

A path to xml or zip file.

Examples

```
essay <- new("Essay", prompt = "Test task", title = "Essay")
## Not run:
# creates folder with XML (side effect)
createQtiTask(essay, "result")
# creates folder with zip (side effect)
createQtiTask(essay, "result", zip = TRUE)
## End(Not run)</pre>
```

createQtiTest-methods Create zip-archive of the qti test specification

Description

Create zip-archive of the qti test specification

Usage

```
createQtiTest(object, dir = NULL, verification = FALSE, zip_only =
FALSE)
## S4 method for signature 'AssessmentItem'
createQtiTest(object, dir = ".", verification = FALSE, zip_only = FALSE)
## S4 method for signature 'AssessmentTest'
createQtiTest(object, dir = getwd(), verification = FALSE, zip_only = FALSE)
## S4 method for signature 'character'
createQtiTest(object, dir = getwd())
```

Arguments

object	An instance of the AssessmentTest, AssessmentTestOpal or AssessmentItem S4 object.
dir	A character value, optional; a folder to store xml file; working directory is used by default.
verification	A boolean value, optional; to check validity of xml files. Default is FALSE.
zip_only	A boolean value, optional; returns only zip file in case of TRUE or zip, xml and downloads files in case of FALSE value. Default is FALSE.

Value

A path to zip and xml files.

22

createResponseDeclaration

Examples

createResponseDeclaration

Create an element responseDeclaration of a qti-xml document

Description

Generic function for creating responseDeclaration element for XML document of specification the question following the QTI schema v2.1

Usage

```
createResponseDeclaration(object)
```

S4 method for signature 'AssessmentItem'
createResponseDeclaration(object)

S4 method for signature 'MatchTable'
createResponseDeclaration(object)

S4 method for signature 'Entry'
createResponseDeclaration(object)

S4 method for signature 'Essay'
createResponseDeclaration(object)

S4 method for signature 'InlineChoice'
createResponseDeclaration(object)

S4 method for signature 'MultipleChoice'
createResponseDeclaration(object)

S4 method for signature 'MultipleChoiceTable'

```
createResponseDeclaration(object)
```

S4 method for signature 'NumericGap'
createResponseDeclaration(object)

S4 method for signature 'Ordering'
createResponseDeclaration(object)

S4 method for signature 'SingleChoice'
createResponseDeclaration(object)

S4 method for signature 'TextGap'
createResponseDeclaration(object)

Arguments

object

an instance of the S4 object (SingleChoice, MultipleChoice, Entry, Ordering, OneInRowTable, OneInColTable, MultipleChoiceTable, DirectedPair, TextGap, NumericGap, InlineChoice)

createResponseProcessing

Create an element responseProcessing of a qti-xml document

Description

Generic function for creating responseProcessing element for XML document of specification the question following the QTI schema v2.1

Usage

```
createResponseProcessing(object)
```

S4 method for signature 'AssessmentItem'
createResponseProcessing(object)

S4 method for signature 'Entry'
createResponseProcessing(object)

S4 method for signature 'Essay'
createResponseProcessing(object)

S4 method for signature 'Gap'
createResponseProcessing(object)

S4 method for signature 'NumericGap'
createResponseProcessing(object)

S4 method for signature 'Ordering'
createResponseProcessing(object)
S4 method for signature 'SingleChoice'
createResponseProcessing(object)
S4 method for signature 'TextGapOpal'
createResponseProcessing(object)

Arguments

```
object an instance of the S4 object (SingleChoice, MultipleChoice, Essay, Entry, Or-
dering, OneInRowTable, OneInColTable, MultipleChoiceTable, DirectedPair,
TextGap, NumericGap, InlineChoice)
```

createText	Compose a set of html elements to display question in qti-xml docu-
	ment

Description

Generic function for creating a set of html elements to display question for XML document of specification the question following the QTI schema v2.1

Usage

```
createText(object)
## S4 method for signature 'Gap'
createText(object)
## S4 method for signature 'InlineChoice'
createText(object)
## S4 method for signature 'character'
createText(object)
```

Arguments

object an instance of the S4 object (Gap, InlineChoice, character)

createZip

Description

Generic function for creating zip archive with set of XML documents of specification the test following the QTI schema v2.1

Usage

createZip(object, input, output, file_name, zip_only)
S4 method for signature 'AssessmentTest'
createZip(object, input, output, file_name, zip_only)
S4 method for signature 'AssessmentTestOpal'

```
createZip(object, input, output, file_name, zip_only)
```

Arguments

object	an instance of the S4 object AssessmentTest or AssessmentTestOpal
input	string, optional; a source folder with xml files
output	string, optional; a folder to store zip and xml files; working directory by default
file_name	string, optional; file name of zip archive
zip_only	boolean, optional; returns only zip file in case of TRUE or zip, xml and down-loads files in case of FALSE value

```
create_assessment_item
```

Compose a root element AssessmentItem of xml task

Description

create_assessment_item() creates html structure with AssessmentItem root element (shiny.tag) for xml qti task description according QTI 2.1

Usage

```
create_assessment_item(object)
```

Arguments

object an instance of the S4 object

Value

A list() with a shiny.tag class

create_qti_task Create XML file for question specification

Description

Create XML file for question specification

Usage

```
create_qti_task(object, dir = NULL, verification = FALSE)
```

Arguments

object	an instance of the S4 object (SingleChoice, MultipleChoice, Essay, Entry, Or-
	dering, OneInRowTable, OneInColTable, MultipleChoiceTable, DirectedPair).
dir	string, optional; a folder to store xml file; working directory by default
verification	boolean, optional; to check validity of xml file, default FALSE

Value

xml document.

create_qti_test Create XML file for exam test specification

Description

Create XML file for exam test specification

Usage

Arguments

object	an instance of the AssessmentTest S4 object
path	string, optional; a path to folder to store zip file with possible file name; working directory by default
verification	boolean, optional; to check validity of xml file, default FALSE
zip_only	boolean, optional; returns only zip file in case of TRUE or zip, xml and down- loads files in case of FALSE value

Value

xml document.

create_question_object

Create rqti S4 AssessmentItem Object from Rmd

Description

Generates an rqti S4 AssessmentItem object (SingleChoice, MultipleChoice, Essay, Entry, Ordering, OneInRowTable, OneInColTable, MultipleChoiceTable, DirectedPair) from an Rmd file.

Usage

```
create_question_object(file)
```

Arguments

file A string representing the path to an Rmd file.

Value

One of the rqti S4 AssessmentItem objects: SingleChoice, MultipleChoice, Essay, Entry, Ordering, OneInRowTable, OneInColTable, MultipleChoiceTable, or DirectedPair.

Examples

create_question_object("file.Rmd")

directedPair Create object DirectedPair

Description

Create object DirectedPair

```
directedPair(
    identifier = generate_id(),
    title = identifier,
    content = list(),
    prompt = "",
    points = 1,
    rows,
    rows_identifiers,
    cols,
    cols_identifiers,
```

directedPair

```
answers_identifiers,
answers_scores = NA_real_,
shuffle = TRUE,
shuffle_rows = TRUE,
shuffle_cols = TRUE,
feedback = list(),
orientation = "vertical",
calculator = NA_character_,
files = NA_character_
```

Arguments

identifier	A character representing the unique identifier of the assessment task. By default, it is generated as 'id_task_dddd', where dddd represents random digits.	
title	A character representing the title of the XML file associated with the task. By default, it takes the value of the identifier.	
content	A character string or a list of character strings to form the text of the question, which may include HTML tags.	
prompt	An optional character representing a simple question text, consisting of one paragraph. This can supplement or replace content in the task. Default is "".	
points	A numeric value, optional, representing the number of points for the entire task. If not provided, the default is calculated as 0.5 points per pair.	
rows	A character vector specifying answer options as the first elements in couples.	
rows_identifiers		
	A character vector, optional, specifies identifiers of the first elements in couples.	
cols	A character vector specifying answer options as the second elements in couples.	
cols_identifiers		
	A character vector, optional, specifies identifiers of the second elements in couples.	
answers_identif	iers	
	A character vector specifying couples of identifiers that combine the correct answers.	
answers_scores	A numeric vector, optional, where each number determines the number of points awarded to a candidate if they select the corresponding answer. If not assigned, the individual values for correct answers are calculated from the task points and the number of correct options.	
shuffle	A boolean value, optional, determining whether to randomize the order in which the choices are initially presented to the candidate. Default is TRUE.	
shuffle_rows	A boolean value, optional, determining whether to randomize the order of the choices only for the first elements of the answer tuples. Default is TRUE.	
shuffle_cols	A boolean value, optional, determining whether to randomize the order of the choices only for the second elements of the answer tuples. Default is TRUE.	
feedback	A list containing feedback message-object ModalFeedback for candidates.	

orientation	A character, optional, determining whether to place answers in vertical or hori- zontal mode. Possible values:
	 "vertical" - Default. "horizontal".
calculator	A character, optional, determining whether to show a calculator to the candidate. Possible values:
	• "simple"
	• "scientific".
files	A character vector, optional, containing paths to files that will be accessible to the candidate during the test/exam.

Value

An object of class DirectedPair

Examples

```
dp_min <- directedPair(content = "<p>\"Directed pairs\" task",
                        rows = c("alfa", "beta", "gamma"),
rows_identifiers = c("a", "b", "g"),
                        cols = c("A", "B", "G;"),
                        cols_identifiers = c("as", "bs", "gs"),
                        answers_identifiers = c("a as", "b bs", 'g gs'))
dp <- directedPair(identifier = "id_task_1234",</pre>
                    title = "Directed Pair Task",
                    content = "\"Directed pairs\" task",
                    prompt = "Plain text, can be used instead of the content",
                    rows = c("alfa", "beta", "gamma"),
                    rows_identifiers = c("a", "b", "g"),
                    cols = c("A", "B", "G"),
                    cols_identifiers = c("as", "bs", "gs"),
                    answers_identifiers = c("a as", "b bs", "g gs"),
                    answers_scores = c(1, 0.5, 0.1),
                    shuffle_rows = FALSE,
                    shuffle_cols = TRUE,
                    orientation = "horizontal")
```

DirectedPair-class Class "DirectedPair"

Description

Class DirectedPair is responsible for creating assessment tasks according to the QTI 2.1 standard, where a candidate has to make binary associations between answer options.

Slots

- identifier A character representing the unique identifier of the assessment task. By default, it is generated as 'id_task_dddd', where dddd represents random digits.
- title A character representing the title of the XML file associated with the task. By default, it takes the value of the identifier.
- content A list of character content to form the text of the question, which can include HTML tags. For tasks of the Entry type, it must also contain at least one instance of Gap objects, such as TextGap, TextGapOpal, NumericGap, or InlineChoice.
- prompt An optional character representing a simple question text, consisting of one paragraph. This can supplement or replace content in the task. Default is "".
- points A numeric value, optional, representing the number of points for the entire task. Default is 1, but pay attention:
 - For tasks of the Entry type, it is calculated as the sum of the gap points by default.
 - For tasks of the DirectedPair, the default is calculated as 0.5 points per pair.
 - For tasks of the MatchTable type, it can also be calculated as the sum of points for individual answers, when provided.
 - For tasks of the MultipleChoice type, points is numeric vector and required. Each number in this vector determines the number of points that will be awarded to a candidate if they select the corresponding answer. The order of the scores must match the order of the choices. It is possible to assign negative values to incorrect answers. All answers with a positive score are considered correct.
- feedback A list containing feedback messages for candidates. Each element of the list should be an instance of either ModalFeedback, CorrectFeedback, or WrongFeedback class.
- calculator A character, optional, determining whether to show a calculator to the candidate. Possible values:
 - "simple"
 - "scientific"
- files A character vector, optional, containing paths to files that will be accessible to the candidate during the test/exam.
- metadata An object of class QtiMetadata that holds metadata information about the task.
- rows A character vector specifying answer options as row names in the table or the first elements in couples in DirectedPair.
- rows_identifiers A character vector, optional, specifying identifiers for answer options defined in rows of the table or identifiers of the first elements in couples in DirectedPair.
- cols A character vector specifying answer options as column headers in the table or the second elements in couples in DirectedPair.
- cols_identifiers A character vector, optional, specifying identifiers for answer options defined in columns of the table or identifiers of the second elements in couples in DirectedPair.
- answers_identifiers A character vector specifying couples of identifiers that combine the correct answers.
- answers_scores A numeric vector, optional, where each number determines the number of points awarded to a candidate if they select the corresponding answer. If not assigned, the individual values for correct answers are calculated from the task points and the number of correct options.

- shuffle A boolean value, optional, determining whether to randomize the order in which the choices are initially presented to the candidate. Default is TRUE.
- shuffle_rows A boolean value, optional, determining whether to randomize the order of the choices only in rows. Default is TRUE.
- shuffle_cols A boolean value, optional, determining whether to randomize the order of the choices only in columns. Default is TRUE.
- orientation A character, optional, determining whether to place answers in vertical or horizontal mode. Possible values:
 - "vertical" Default.
 - "horizontal"

Examples

dropdown

Create YAML string for InlineChoice object (dropdown list)

Description

Create YAML string for InlineChoice object (dropdown list)

```
dropdown(
    choices,
    solution_index = 1,
    points = 1,
    shuffle = TRUE,
    response_identifier = NULL
)
```

entry

Arguments

choices	A numeric or character vector; contains values of possible answers. If you use a named vector, the names will be used as identifiers.
solution_index	An integer value, optional; the number of right answer in the choices vector. Default is 1.
points	A numeric value, optional; the number of points for this gap. Default is 1.
shuffle	A boolean, optional; is responsible to randomize the order in which the choices are initially presented to the candidate. Default is TRUE.
response_identifier	
	A character string, optional; an identifier for the answer.

Value

A character string mapped as yaml.

See Also

gap_text(), gap_numeric(), mdlist()

Examples

```
dropdown(c("Option A", "Option B"), response_identifier = "task_dd_list")
```

entry

Create object Entry

Description

Create object Entry

```
entry(
    identifier = generate_id(),
    title = identifier,
    content = list(),
    prompt = "",
    points = 1,
    feedback = list(),
    calculator = NA_character_,
    files = NA_character_
)
```

Arguments

identifier	A character representing the unique identifier of the assessment task. By default, it is generated as 'id_task_dddd', where dddd represents random digits.
title	A character representing the title of the XML file associated with the task. By default, it takes the value of the identifier.
content	A list of character content to form the text of the question, which can include HTML tags. For tasks of the Entry type, it must also contain at least one instance of Gap objects, such as TextGap, TextGapOpal, NumericGap, or InlineChoice.
prompt	An optional character representing a simple question text, consisting of one paragraph. This can supplement or replace content in the task. Default is "".
points	A numeric value, it is calculated as the sum of the gap points by default.
feedback	A list containing feedback message-object ModalFeedback for candidates.
calculator	A character, optional, determining whether to show a calculator to the candidate. Possible values:
	• "simple"
	• "scientific".
files	A character vector, optional, containing paths to files that will be accessible to the candidate during the test/exam.

Value

An object of class Entry

See Also

[textGap()][numericGap()][textGapOpal()]

Examples

Entry-class

Description

Class Entry is responsible for creating assessment tasks according to the QTI 2.1 standard. These tasks include one or more instances of text input fields (with numeric or text answers) or dropdown lists.

Slots

- identifier A character representing the unique identifier of the assessment task. By default, it is generated as 'id_task_dddd', where dddd represents random digits.
- title A character representing the title of the XML file associated with the task. By default, it takes the value of the identifier.
- content A list of character content to form the text of the question, which can include HTML tags. For tasks of the Entry type, it must also contain at least one instance of Gap objects, such as TextGap, TextGapOpal, NumericGap, or InlineChoice.
- prompt An optional character representing a simple question text, consisting of one paragraph. This can supplement or replace content in the task. Default is "".
- points A numeric value, optional, representing the number of points for the entire task. Default is 1, but pay attention:
 - For tasks of the Entry type, it is calculated as the sum of the gap points by default.
 - For tasks of the DirectedPair, the default is calculated as 0.5 points per pair.
 - For tasks of the MatchTable type, it can also be calculated as the sum of points for individual answers, when provided.
 - For tasks of the MultipleChoice type, points is numeric vector and required. Each number in this vector determines the number of points that will be awarded to a candidate if they select the corresponding answer. The order of the scores must match the order of the choices. It is possible to assign negative values to incorrect answers. All answers with a positive score are considered correct.
- feedback A list containing feedback messages for candidates. Each element of the list should be an instance of either ModalFeedback, CorrectFeedback, or WrongFeedback class.
- calculator A character, optional, determining whether to show a calculator to the candidate. Possible values:
 - "simple"
 - "scientific"
- files A character vector, optional, containing paths to files that will be accessible to the candidate during the test/exam.
- metadata An object of class QtiMetadata that holds metadata information about the task.

  files = NA_character_
```

essay

Arguments

identifier	A character representing the unique identifier of the assessment task. By default, it is generated as 'id_task_dddd', where dddd represents random digits.
title	A character representing the title of the XML file associated with the task. By default, it takes the value of the identifier.
content	A character string or a list of character strings to form the text of the question, which may include HTML tags.
prompt	An optional character representing a simple question text, consisting of one paragraph. This can supplement or replace content in the task. Default is "".
points	A numeric value, optional, representing the number of points for the entire task. Default is 1.
feedback expected_lengt	A list containing feedback message-object ModalFeedback for candidates.
	A numeric, optional. Responsible for setting the size of the text input field in the content delivery engine. By default it will be calculated according to model answer in the slot content of ModalFeedback.
expected_lines	A numeric, optional. Responsible for setting the number of rows of the text input field in the content delivery engine. By default it will be calculated according to model answer in the slot content of ModalFeedback.
words_max	A numeric, optional. Responsible for setting the maximum number of words that a candidate can write in the text input field. By default it will be calculated according to model answer in the slot content of ModalFeedback.
words_min	A numeric, optional. Responsible for setting the minimum number of words that a candidate should write in the text input field.
data_allow_pas	te
	A boolean, optional. Determines whether it is possible for a candidate to copy text into the text input field. Default is FALSE.
calculator	 A character, optional, determining whether to show a calculator to the candidate. Possible values: "simple" "scientific".
files	A character vector, optional, containing paths to files that will be accessible to the candidate during the test/exam.

Value

An object of class Essay

Examples

Essay-class

Class "Essay"

Description

Class Essay is responsible for creating essay type of assessment task according to QTI 2.1.

Slots

- identifier A character representing the unique identifier of the assessment task. By default, it is generated as 'id_task_dddd', where dddd represents random digits.
- title A character representing the title of the XML file associated with the task. By default, it takes the value of the identifier.
- content A list of character content to form the text of the question, which can include HTML tags. For tasks of the Entry type, it must also contain at least one instance of Gap objects, such as TextGap, TextGapOpal, NumericGap, or InlineChoice.
- prompt An optional character representing a simple question text, consisting of one paragraph. This can supplement or replace content in the task. Default is "".
- points A numeric value, optional, representing the number of points for the entire task. Default is 1, but pay attention:
 - For tasks of the Entry type, it is calculated as the sum of the gap points by default.
 - For tasks of the DirectedPair, the default is calculated as 0.5 points per pair.
 - For tasks of the MatchTable type, it can also be calculated as the sum of points for individual answers, when provided.
 - For tasks of the MultipleChoice type, points is numeric vector and required. Each number in this vector determines the number of points that will be awarded to a candidate if they select the corresponding answer. The order of the scores must match the order of the choices. It is possible to assign negative values to incorrect answers. All answers with a positive score are considered correct.
- feedback A list containing feedback messages for candidates. Each element of the list should be an instance of either ModalFeedback, CorrectFeedback, or WrongFeedback class.
- calculator A character, optional, determining whether to show a calculator to the candidate. Possible values:

38

extract_results

- "simple"
- "scientific"
- files A character vector, optional, containing paths to files that will be accessible to the candidate during the test/exam.
- metadata An object of class QtiMetadata that holds metadata information about the task.
- expected_length A numeric, optional. Responsible for setting the size of the text input field in the content delivery engine.
- expected_lines A numeric, optional. Responsible for setting the number of rows of the text input field in the content delivery engine.
- words_max A numeric, optional. Responsible for setting the maximum number of words that a candidate can write in the text input field.
- words_min A numeric, optional. Responsible for setting the minimum number of words that a candidate should write in the text input field.
- data_allow_paste A logical, optional. Determines whether it is possible for a candidate to copy text into the text input field. Default is FALSE.

Note

If 'ModalFeedback' is given, default values for slots related to the text input field are calculated automatically.

Examples

extract_results Create data frame with test results

Description

The function extract_results() takes Opal zip archive "Export results" or xml file and creates two kinds of data frames (according to parameter 'level'), see the 'Details' section.

Usage

```
extract_results(file, level = "exercises", hide_filename = TRUE)
```

Arguments

file	A string with a path of the xml test result file.
level	A string with two possible values: exercises and items.
hide_filename	A boolean value, TRUE to hide original file names by default.

Value

A dataframe with attribues of the candidates outcomes and result variables.

Note

1. With option level = "exercises" data frame consists of columns:

- 'file' name of the xml file with test results (to identify candidate)
- 'date' date and time of test
- 'id_question' question item identifier
- 'duration' time in sec. what candidate spent on this item
- · 'score_candidate' points that were given to candidate after evaluation
- 'score_max' max possible score for this question
- 'question_type' the type of question
- 'is_answer_given' TRUE if candidate gave the answer on question, otherwise FALSE
- · 'title' the values of attribute 'title' of assessment items

2. With option level = "items" data frame consists of columns:

- 'file' name of the xml file with test results (to identify candidate)
- 'date' date and time of test
- 'id_question' question item identifier
- 'base_type' type of answer (identifier, string or float)
- · 'cardinalities' defines whether this question is single, multiple or ordered -value
- 'qti_type' specifies the type of the task
- 'id_answer' identifier of each response variable
- · 'expected_response' values that considered as right responses for question
- · 'candidate_response' values that were given by candidate
- · 'score_candidate' - points that were given to candidate after evaluation
- 'score_max' max possible score for this question item
- · 'is_response_correct' TRUE if candidate gave the right response, otherwise FALSE
- · 'title' the values of attribute 'title' of assessment items

Gap-class

Examples

```
file <- system.file("test_results.zip", package='rqti')
df <- extract_results(file, level = "items")</pre>
```

Gap-class

Class "Gap"

Description

Abstract class Gap is not meant to be instantiated directly; instead, it serves as a base for derived classes such as NumericGap, TextGap, TextGapOpal and InlineChoice.

Slots

response_identifier A character value representing an identifier for the answer. By default, it is generated as 'id_gap_dddd', where dddd represents random digits.

points A numeric value, optional, representing the number of points for this gap. Default is 1.

- placeholder A character value, optional, responsible for placing helpful text in the text input field in the content delivery engine.
- expected_length A numeric value, optional, responsible for setting the size of the text input field in the content delivery engine.

See Also

NumericGap, TextGap, TextGapOpal and InlineChoice.

```
gap_numeric Create YAML string for NumericGap object
```

Description

Create YAML string for NumericGap object

Usage

```
gap_numeric(
  solution,
  tolerance = 0,
  tolerance_type = "absolute",
  points = 1,
  response_identifier = NULL,
  include_lower_bound = TRUE,
  include_upper_bound = TRUE,
  expected_length = size_gap(solution),
  placeholder = NULL
)
```

solution	A numeric value; contains right answer for this numeric entry.	
tolerance	A numeric value, optional; specifies the value for up and low boundaries of tolerance rate for candidate answer. Default is 0.	
tolerance_type	A character string, optional; specifies tolerance mode; possible values:"exact", "absolute" (by default), "relative".	
points	A numeric value, optional; the number of points for this gap. Default is 1.	
response_ident	ifier	
	A character string, optional; an identifier for the answer.	
include_lower_bound		
	A boolean, optional; specifies whether or not the lower bound is included in tolerance rate.	
include_upper_bound		
	A boolean, optional; specifies whether or not the upper bound is included in tolerance rate.	
expected_length		
	An integer value, optional; is responsible to set a size of text input field in con- tent delivery engine.	
placeholder	A character string, optional; is responsible to place some helpful text in text input field in content delivery engine.	

Value

A character string mapped as yaml.

See Also

gap_text(), dropdown(), mdlist()

Examples

```
gap_numeric(5.0, tolerance = 10, tolerance_type = "relative")
```

gap_text

Create YAML string for TextGap object

Description

Create YAML string for TextGap object

gap_text

Usage

```
gap_text(
   solution,
   tolerance = NULL,
   case_sensitive = FALSE,
   points = 1,
   response_identifier = NULL,
   expected_length = size_gap(solution),
   placeholder = NULL
)
```

Arguments

solution	A character vector containing values considered as correct answers.	
tolerance	An integer value, optional; defines the number of characters to tolerate spelling mistakes in evaluating candidate answers.	
case_sensitive	A boolean, optional; determines whether the evaluation of the correct answer is case sensitive. Default is FALSE.	
points	A numeric value, optional; the number of points for this gap. Default is 1.	
response_identifier		
	A character string (optional) representing an identifier for the answer.	
expected_length		
	An integer value, optional; sets the size of the text input field in the content delivery engine.	
placeholder	A character string, optional; places helpful text in the text input field in the content delivery engine.	

Value

A character string mapped as yaml.

```

getAssessmentItems Get list of AssessmentItems for AssessmentSection

Description

Generic function for

Usage

```
getAssessmentItems(object)
```

S4 method for signature 'AssessmentItem'
getAssessmentItems(object)

S4 method for signature 'AssessmentSection'
getAssessmentItems(object)

S4 method for signature 'character'
getAssessmentItems(object)

Arguments

object an instance of the S4 object (AssessmentSection, AssessmentItem)

getCalculator-methods Get value of the slot 'calculator'

Description

Get value of the slot 'calculator'

Usage

```
getCalculator(object)
```

S4 method for signature 'AssessmentItem'
getCalculator(object)

S4 method for signature 'AssessmentSection'
getCalculator(object)

S4 method for signature 'character'
getCalculator(object)

object

an instance of the S4 object (SingleChoice, MultipleChoice, Essay, Entry, Ordering, OneInRowTable, OneInColTable, MultipleChoiceTable, DirectedPair, TextGap, NumericGap, InlineChoice)

getContributors-methods

Get list of contributors values

Description

Get list of contributors values

Usage

getContributors(object)

S4 method for signature 'AssessmentItem'
getContributors(object)

S4 method for signature 'AssessmentSection'
getContributors(object)

```
## S4 method for signature 'character'
getContributors(object)
```

Arguments

object an instance of the S4 object (SingleChoice, MultipleChoice, Essay, Entry, Ordering, OneInRowTable, OneInColTable, MultipleChoiceTable, DirectedPair, TextGap, NumericGap, InlineChoice)

Description

Get elements of the course by courseId from LMS

Usage

getCourseElements(object, course_id)

object	An S4 object of class LMS that represents a connection to the LMS.
course_id	A length one character vector with course id.

Value

A dataframe with the elements of the course.

getCourseElements,Opal-method

Retrieve Data About Course Elements from LMS Opal

Description

This function retrieves and returns data about the elements of a specified course from the LMS Opal system. The data includes information such as the node ID, short title, short name, and long title of each element.

Usage

S4 method for signature 'Opal'
getCourseElements(object, course_id)

Arguments

object	An S4 object of class Opal that represents a connection to the LMS.
course_id	A length one character vector with course id.

Value

A dataframe with the data of the elements of the course (fields: nodeId, shortTitle, shortName, longTitle) on LMS Opal.

getCourseResult Get zip with course results by resource id and node id

Description

Get zip with course results by resource id and node id

Usage

```
getCourseResult(object, resource_id, node_id, path_outcome = ".", ...)
```

object	An S4 object of class LMS that represents a connection to the LMS.
resource_id	A length one character vector with resource id.
node_id	A length one character vector with node id (test).
path_outcome	A length one character vector with path, where the zip should be stored. Default is working directory.
	Additional arguments to be passed to the method, if applicable.

Value

It downloads a zip and return a character string with path.

Examples

```
zip_file <- getCourseResult("89068111333293", "1617337826161777006")</pre>
```

getCourseResult,Opal-method

Get zip with course results by resource id and node id

Description

Get zip with course results by resource id and node id

Usage

```
## S4 method for signature 'Opal'
getCourseResult(
   object,
   resource_id,
   node_id,
   path_outcome = ".",
   rename = TRUE
)
```

Arguments

object	An S4 object of class Opal that represents a connection to the LMS.
resource_id	A length one character vector with resource id.
node_id	A length one character vector with node id (test).
path_outcome	A length one character vector with path, where the zip should be stored. Default is working directory.
rename	A boolean value; optional; Set TRUE value to take the short name of the course element for naming zip (results_shortName.zip). FALSE combines in zip name course id and node id. Default is TRUE.

Value

It downloads a zip and return a character string with path.

getFiles-methods Get file paths for attachment of test

Description

Get file paths for attachment of test

Usage

getFiles(object)

S4 method for signature 'AssessmentItem'
getFiles(object)

S4 method for signature 'AssessmentSection'
getFiles(object)

S4 method for signature 'character'
getFiles(object)

Arguments

object

an instance of the S4 object (SingleChoice, MultipleChoice, Essay, Entry, Ordering, OneInRowTable, OneInColTable, MultipleChoiceTable, DirectedPair, TextGap, NumericGap, InlineChoice)

getIdentifier-methods Get identifier

Description

Get identifier

Usage

```
getIdentifier(object)
## S4 method for signature 'AssessmentItem'
getIdentifier(object)
## S4 method for signature 'AssessmentSection'
getIdentifier(object)
```

```
## S4 method for signature 'Gap'
getIdentifier(object)
## S4 method for signature 'character'
getIdentifier(object)
```

object an instance of the S4 object (SingleChoice, MultipleChoice, Essay, Entry, Ordering, OneInRowTable, OneInColTable, MultipleChoiceTable, DirectedPair, TextGap, NumericGap, InlineChoice)

getLMSResources Get records of all current user's resources on LMS	getLMSResources	Get records of all current user's resources on LMS
--	-----------------	--

Description

Get records of all current user's resources on LMS

Usage

getLMSResources(object)

Arguments

object An S4 object of class LMS that represents a connection to the LMS.

Value

A dataframe with attributes of user's resources.

Examples

df <- getLMSResources()</pre>

getLMSResources,Opal-method

Get records of all current user's resources on LMS Opal

Description

Get records of all current user's resources on LMS Opal

Usage

```
## S4 method for signature 'Opal'
getLMSResources(object)
```

Arguments

object An S4 object of class Opal that represents a connection to the LMS.

Value

A dataframe with attributes of user's resources.

Examples

df <- getLMSResources()</pre>

getLMSResourcesByName Get select records about user resources by name.

Description

Get select records about user resources by name.

Usage

```
getLMSResourcesByName(object, display_name, rtype = NULL)
```

Arguments

object	An S4 object of class LMS that represents a connection to the LMS.
display_name	A string value withe the name of resource.
rtype	A string value with the type of resource. Possible values: "FileResource.TEST", "FileResource.QUESTION", or "FileResource.SURVEY".

Value

A dataframe with attributes of user's resources.

Examples

df <- getLMSResourcesByName()</pre>

getLMSResourcesByName,Opal-method

Get selected records of the current user's resources on LMS Opal by display name.

Description

Get selected records of the current user's resources on LMS Opal by display name.

Usage

```
## S4 method for signature 'Opal'
getLMSResourcesByName(object, display_name, rtype = NULL)
```

Arguments

object	An S4 object of class Opal that represents a connection to the LMS.
display_name	A string value withe the name of resource.
rtype	A string value with the type of resource. Possible values: "FileResource.TEST", "FileResource.QUESTION", or "FileResource.SURVEY".

Value

A dataframe with attributes of user's resources.

Examples

df <- getLMSResourcesByName()</pre>

getLMSResourceURL Create a URL using the resource's display name in LMS

Description

Create a URL using the resource's display name in LMS

Usage

```
getLMSResourceURL(object, display_name)
```

Arguments

object	An S4 object of class LMS that represents a connection to the LMS.
display_name	A length one character vector to entitle file in LMS; it takes file name without
	extension by default; optional.

Value

A string value of URL.

```
getLMSResourceURL, Opal-method
```

Create a URL using the resource's display name in LMS Opal

Description

Create a URL using the resource's display name in LMS Opal

Usage

S4 method for signature 'Opal'
getLMSResourceURL(object, display_name)

Arguments

object	An S4 object of class Opal that represents a connection to the LMS.
display_name	A length one character vector to entitle file in OPAL; it takes file name without
	extension by default; optional.

Value

A string value of URL.

getObject-methods Get object

Description

Get object

Usage

getObject(object)

S4 method for signature 'AssessmentItem'
getObject(object)

S4 method for signature 'AssessmentSection'
getObject(object)

S4 method for signature 'character'
getObject(object)

Arguments

```
object an instance of the S4 object (SingleChoice, MultipleChoice, Essay, Entry, Or-
dering, OneInRowTable, OneInColTable, MultipleChoiceTable, DirectedPair,
TextGap, NumericGap, InlineChoice)
```

getPoints-methods Get points from AssessmentItem object

Description

Get points from AssessmentItem object

Usage

```
getPoints(object)
```

S4 method for signature 'AssessmentItem'
getPoints(object)

S4 method for signature 'AssessmentSection'
getPoints(object)

S4 method for signature 'MultipleChoice'
getPoints(object)

```
## S4 method for signature 'character'
getPoints(object)
```

objectan instance of the S4 object (SingleChoice, MultipleChoice, Essay, Entry, Or-
dering, OneInRowTable, OneInColTable, MultipleChoiceTable, DirectedPair,
TextGap, NumericGap, InlineChoice)

getResponse

Get and process a piece of question content

Description

Generic function to get and process a different types of question content (text with instances of gaps or dropdown lists) for XML document of specification the question following the QTI schema v2.1

Usage

getResponse(object)
S4 method for signature 'InlineChoice'
getResponse(object)
S4 method for signature 'NumericGap'
getResponse(object)
S4 method for signature 'TextGap'
getResponse(object)
S4 method for signature 'character'
getResponse(object)

Arguments

object an instance of the S4 object (NumericGap, TextGap, InlineChoice, character)

inlineChoice

Description

Create object InlineChoice

Usage

```
inlineChoice(
   choices,
   solution_index = 1,
   response_identifier = generate_id(type = "gap"),
   choices_identifiers = paste0("Choice", LETTERS[seq(choices)]),
   points = 1,
   shuffle = TRUE,
   placeholder = "",
   expected_length = size_gap(choices)
)
```

Arguments

choices	A character vector containing the answers shown in the dropdown list.
solution_index	A numeric value, optional, representing the index of the correct answer in the options vector. Default is 1.
response_identi	ifier
	A character value representing an identifier for the answer. By default, it is generated as 'id_gap_dddd', where dddd represents random digits.
choices_identif	fiers
	A character vector, optional, containing a set of identifiers for answers. By default, identifiers are generated automatically according to the template "OptionD", where D is a letter representing the alphabetical order of the answer in the list.
points	A numeric value, optional, representing the number of points for this gap. Default is 1
shuffle	A boolean value, optional, determining whether to randomize the order in which the choices are initially presented to the candidate. Default is TRUE.
placeholder	A character value, optional, responsible for placing helpful text in the text input field in the content delivery engine. Default is "".
expected_length	
	A numeric value, optional, responsible for setting the size of the text input field in the content delivery engine. Default value is adjusted by the first choice size.

Value

An object of class InlineChoice

See Also

[entry()][numericGap()][textGap()][textGapOpal()]

Examples

InlineChoice-class Class "InlineChoice"

Description

Class InlineChoice is responsible for creating instances of dropdown lists as answer options in Entry type assessment tasks according to the QTI 2.1 standard.

Slots

- response_identifier A character value representing an identifier for the answer. By default, it is generated as 'id_gap_dddd', where dddd represents random digits.
- points A numeric value, optional, representing the number of points for this gap. Default is 1.
- placeholder A character value, optional, responsible for placing helpful text in the text input field in the content delivery engine.
- expected_length A numeric value, optional, responsible for setting the size of the text input field in the content delivery engine.
- choices A character vector containing the answers shown in the dropdown list.
- solution_index A numeric value, optional, representing the index of the correct answer in the options vector. Default is 1.
- choices_identifiers A character vector, optional, containing a set of identifiers for answers. By default, identifiers are generated automatically according to the template "OptionD", where D is a letter representing the alphabetical order of the answer in the list.
- shuffle A boolean value, optional, determining whether to randomize the order in which the choices are initially presented to the candidate. Default is TRUE.

See Also

Entry, NumericGap, TextGap, TextGapOpal

isUserLoggedIn

Examples

```
dd <- new("InlineChoice",
    response_identifier = "id_gap_1234",
    points = 1,
    choices = c("answer1", "answer2", "answer3"),
    solution_index = 1,
    choices_identifiers = c("OptionA", "OptionB", "OptionC"),
    shuffle = TRUE)</pre>
```

isUserLoggedIn Check if User is Logged in LMS

Description

This method checks whether a user is logged into an LMS (Learning Management System) by sending a request to the LMS server and evaluating the response.

This method checks whether a user is logged into an LMS Opal by sending a request to the LMS server and evaluating the response.

Usage

isUserLoggedIn(object)

S4 method for signature 'Opal'
isUserLoggedIn(object)

Arguments

object An S4 object of class Opal that represents a connection to the LMS.

Value

A logical value (TRUE if the user is logged in, FALSE otherwise).

A logical value (TRUE if the user is logged in, FALSE otherwise).

LMS-class

Class LMS

Description

Abstract class LMS is represents learning management system.

MatchTaable-classs Class "MatchTable"

Description

Abstract class MatchTable is not meant to be instantiated directly; instead, it serves as a base for derived classes such as OneInRowTable, OneInColTable, MultipleChoiceTable, and DirectedPair.

Slots

- identifier A character representing the unique identifier of the assessment task. By default, it is generated as 'id_task_dddd', where dddd represents random digits.
- title A character representing the title of the XML file associated with the task. By default, it takes the value of the identifier.
- content A list of character content to form the text of the question, which can include HTML tags. For tasks of the Entry type, it must also contain at least one instance of Gap objects, such as TextGap, TextGapOpal, NumericGap, or InlineChoice.
- prompt An optional character representing a simple question text, consisting of one paragraph. This can supplement or replace content in the task. Default is "".
- points A numeric value, optional, representing the number of points for the entire task. Default is 1, but pay attention:
 - For tasks of the Entry type, it is calculated as the sum of the gap points by default.
 - For tasks of the DirectedPair, the default is calculated as 0.5 points per pair.
 - For tasks of the MatchTable type, it can also be calculated as the sum of points for individual answers, when provided.
 - For tasks of the MultipleChoice type, points is numeric vector and required. Each number in this vector determines the number of points that will be awarded to a candidate if they select the corresponding answer. The order of the scores must match the order of the choices. It is possible to assign negative values to incorrect answers. All answers with a positive score are considered correct.
- feedback A list containing feedback messages for candidates. Each element of the list should be an instance of either ModalFeedback, CorrectFeedback, or WrongFeedback class.
- calculator A character, optional, determining whether to show a calculator to the candidate. Possible values:
 - "simple"
 - "scientific"
- files A character vector, optional, containing paths to files that will be accessible to the candidate during the test/exam.
- metadata An object of class QtiMetadata that holds metadata information about the task.
- rows A character vector specifying answer options as row names in the table or the first elements in couples in DirectedPair.
- rows_identifiers A character vector, optional, specifying identifiers for answer options defined in rows of the table or identifiers of the first elements in couples in DirectedPair.

- cols A character vector specifying answer options as column headers in the table or the second elements in couples in DirectedPair.
- cols_identifiers A character vector, optional, specifying identifiers for answer options defined in columns of the table or identifiers of the second elements in couples in DirectedPair.
- answers_identifiers A character vector specifying couples of identifiers that combine the correct answers.
- answers_scores A numeric vector, optional, where each number determines the number of points awarded to a candidate if they select the corresponding answer. If not assigned, the individual values for correct answers are calculated from the task points and the number of correct options.
- shuffle A boolean value, optional, determining whether to randomize the order in which the choices are initially presented to the candidate. Default is TRUE.
- shuffle_rows A boolean value, optional, determining whether to randomize the order of the choices only in rows. Default is TRUE.
- shuffle_cols A boolean value, optional, determining whether to randomize the order of the choices only in columns. Default is TRUE.

See Also

OneInRowTable, OneInColTable, MultipleChoiceTable, DirectedPair

mdlist

Create a markdown list for answer options

Description

Create a markdown list for answer options

Usage

mdlist(vect, solutions = NULL, gaps = NULL)

Arguments

vect	A string or numeric vector of answer options for single/multiple choice task.
solutions	An integer value, optional; indexes of right answer options in vect.
gaps	numeric or string vector, optional; provides primitive gap description if there is
	a need to build a list of gaps.

Value

A markdown list.

See Also

gap_text(), gap_numeric(), dropdown()

Examples

```
#list for multiple choice task
mdlist(c("A", "B", "C"), c(2, 3))
# it returns:
#- A
#- *B*
#- *C*
#list of gaps
mdlist(c("A", "B", "C"), c(2, 3), c(1, 2, 3))
# it returns:
#- A <gap>1</gap>
#- *B* <gap>2</gap>
#- *C* <gap>3</gap>
```

modalFeedback

Create object ModalFeedback

Description

Create object ModalFeedback

Usage

```
modalFeedback(content = list(), title = character(0), show = TRUE)
```

Arguments

content	A character string or a list of character strings to form the text of the question, which may include HTML tags.
title	A character value, optional, representing the title of the modal feedback window.
show	A boolean value, optional, determining whether to show (TRUE) or hide (FALSE) the modal feedback. Default is TRUE.

Value

An object of class ModalFeedback

Examples

```
fb <- modalFeedback(content = "Model answer", title = "Feedback")</pre>
```

60

ModalFeedback-class Class "ModalFeedback"

Description

Class ModalFeedback is responsible for delivering feedback messages to the candidate, regardless of whether the answer was correct or incorrect.

Slots

- outcome_identifier A character representing the unique identifier of the outcome declaration variable that relates to feedback. Default is "FEEDBACKMODAL".
- show A boolean value, optional, determining whether to show (TRUE) or hide (FALSE) the modal feedback. Default is TRUE.
- title A character value, optional, representing the title of the modal feedback window.
- content A list of character content to form the text of the modal feedback, which can include HTML tags.
- identifier A character value representing the identifier of the modal feedback item. Default is "modal_feedback".

Examples

multipleChoice Create object MultipleChoice

Description

Create object MultipleChoice

Usage

```
multipleChoice(
    identifier = generate_id(),
    title = identifier,
    choices,
    choice_identifiers = paste0("Choice", LETTERS[seq(choices)]),
    content = list(),
    prompt = "",
    points = 1,
    feedback = list(),
```

```
orientation = "vertical",
shuffle = TRUE,
calculator = NA_character_,
files = NA_character_
)
```

identifier	A character representing the unique identifier of the assessment task. By default, it is generated as 'id_task_dddd', where dddd represents random digits.
title	A character representing the title of the XML file associated with the task. By default, it takes the value of the identifier.
choices	A character vector defining a set of answer options in the question.
choice_identif	
	A character vector, optional, containing a set of identifiers for answers. By de- fault, identifiers are generated automatically according to the template "ChoiceD", where D is a letter representing the alphabetical order of the answer in the list.
content	A character string or a list of character strings to form the text of the question, which may include HTML tags.
prompt	An optional character representing a simple question text, consisting of one paragraph. This can supplement or replace content in the task. Default is "".
points	A numeric vector, required. Each number in this vector determines the number of points that will be awarded to a candidate if they select the corresponding an- swer. The order of the scores must match the order of the choices. It is possible to assign negative values to incorrect answers. All answers with a positive score are considered correct.
feedback	A list containing feedback messages for candidates. Each element of the list should be an instance of either ModalFeedback, CorrectFeedback, or WrongFeedback class.
orientation	A character, determining whether to place answers in vertical or horizontal mode. Possible values:
	 "vertical" - Default, "horizontal".
shuffle	A boolean value indicating whether to randomize the order in which the choices are initially presented to the candidate. Default is TRUE.
calculator	A character, optional, determining whether to show a calculator to the candidate. Possible values:
	• "simple"
	• "scientific".
files	A character vector, optional, containing paths to files that will be accessible to the candidate during the test/exam.

Value

An object of class MultipleChoice

Examples

MultipleChoice-class Class "MultipleChoice"

Description

Class MultipleChoice is responsible for creating multiple choice assessment task according to QTI 2.1.

Slots

- identifier A character representing the unique identifier of the assessment task. By default, it is generated as 'id_task_dddd', where dddd represents random digits.
- title A character representing the title of the XML file associated with the task. By default, it takes the value of the identifier.
- content A list of character content to form the text of the question, which can include HTML tags. For tasks of the Entry type, it must also contain at least one instance of Gap objects, such as TextGap, TextGapOpal, NumericGap, or InlineChoice.
- prompt An optional character representing a simple question text, consisting of one paragraph. This can supplement or replace content in the task. Default is "".
- points A numeric value, optional, representing the number of points for the entire task. Default is 1, but pay attention:
 - For tasks of the Entry type, it is calculated as the sum of the gap points by default.
 - For tasks of the DirectedPair, the default is calculated as 0.5 points per pair.
 - For tasks of the MatchTable type, it can also be calculated as the sum of points for individual answers, when provided.

- For tasks of the MultipleChoice type, points is numeric vector and required. Each number in this vector determines the number of points that will be awarded to a candidate if they select the corresponding answer. The order of the scores must match the order of the choices. It is possible to assign negative values to incorrect answers. All answers with a positive score are considered correct.
- feedback A list containing feedback messages for candidates. Each element of the list should be an instance of either ModalFeedback, CorrectFeedback, or WrongFeedback class.
- calculator A character, optional, determining whether to show a calculator to the candidate. Possible values:
 - "simple"
 - "scientific"
- files A character vector, optional, containing paths to files that will be accessible to the candidate during the test/exam.
- metadata An object of class QtiMetadata that holds metadata information about the task.
- choices A character vector defining a set of answer options in the question.
- choice_identifiers A character vector, optional, containing a set of identifiers for answers. By default, identifiers are generated automatically according to the template "ChoiceD", where D is a letter representing the alphabetical order of the answer in the list.
- shuffle A boolean value indicating whether to randomize the order in which the choices are initially presented to the candidate. Default is TRUE.
- orientation A character, determining whether to place answers in vertical or horizontal mode. Possible values:
 - "vertical" Default.
 - "horizontal"

Examples

multipleChoiceTable Create object MultipleChoiceTable

Description

Create object MultipleChoiceTable

Usage

```
multipleChoiceTable(
  identifier = generate_id(),
  title = identifier,
  content = list(),
  prompt = "",
  points = 1,
  rows,
  rows_identifiers,
  cols,
  cols_identifiers,
  answers_identifiers,
  answers_scores = NA_real_,
  shuffle = TRUE,
  shuffle_rows = TRUE,
  shuffle_cols = TRUE,
  feedback = list(),
  calculator = NA_character_,
  files = NA_character_
)
```

Arguments

identifier	A character representing the unique identifier of the assessment task. By default, it is generated as 'id_task_dddd', where dddd represents random digits.
title	A character representing the title of the XML file associated with the task. By default, it takes the value of the identifier.
content	A character string or a list of character strings to form the text of the question, which may include HTML tags.
prompt	An optional character representing a simple question text, consisting of one paragraph. This can supplement or replace content in the task. Default is "".
points	A numeric value, optional, representing the number of points for the entire task. It can also be calculated as the sum of points for individual answers, when pro- vided. Default is 1.
rows	A character vector specifying answer options defined in rows of the table.
rows_identifiers	

A character vector, optional, specifies identifiers of the rows of the table

cols	A character vector specifying answer options defined in columns of the table.
cols_identifier	^S
	A character vector, optional, specifies identifiers of the columns of the table.
answers_identif	fiers
	A character vector specifying couples of identifiers that combine the correct answers.
answers_scores	A numeric vector, optional, where each number determines the number of points awarded to a candidate if they select the corresponding answer. If not assigned, the individual values for correct answers are calculated from the task points and the number of correct options.
shuffle	A boolean value, optional, determining whether to randomize the order in which the choices are initially presented to the candidate. Default is TRUE.
shuffle_rows	A boolean value, optional, determining whether to randomize the order of the choices only for the first elements of the answer tuples. Default is TRUE.
shuffle_cols	A boolean value, optional, determining whether to randomize the order of the choices only for the second elements of the answer tuples. Default is TRUE.
feedback	A list containing feedback message-object ModalFeedback for candidates.
calculator	A character, optional, determining whether to show a calculator to the candidate. Possible values:
	 "simple" "scientific".
files	A character vector, optional, containing paths to files that will be accessible to the candidate during the test/exam.

Value

An object of class MultipleChoiceTable

Examples

```
mt_min <- multipleChoiceTable(content = "<p>\"Multiple choice table\" task",
                        rows = c("alfa", "beta", "gamma", "alpha"),
                        rows_identifiers = c("a", "b", "g", "aa"),
                        cols = c("A", "B", "G", "a"),
                        cols_identifiers = c("as", "bs", "gs", "aas"),
                answers_identifiers = c("a as", "b bs", "g gs", "aa as", "a aas", "aa aas"))
mt <- multipleChoiceTable(identifier = "id_task_1234",</pre>
                    title = "Table with many possible answers in rows and cols",
                    content = "\"Multiple choice table\" task",
                    prompt = "Plain text, can be used instead of the content",
                   rows = c("alfa", "beta", "gamma", "alpha"),
rows_identifiers = c("a", "b", "g", "aa"),
                    cols = c("A", "B", "G", "a"),
                    cols_identifiers = c("as", "bs", "gs", "aas"),
               answers_identifiers = c("a as", "b bs", "g gs", "aa as", "a aas", "aa aas"),
                    answers_scores = c(1, 0.5, 0.1, 1, 0.5, 1),
                    shuffle_rows = FALSE,
                    shuffle_cols = TRUE)
```

MultipleChoiceTable-class

Class "MultipleChoiceTable"

Description

Class MultipleChoiceTable is responsible for creating assessment tasks according to the QTI 2.1 standard with a table of answer options, where many correct answers in each row and column are possible.

Slots

- identifier A character representing the unique identifier of the assessment task. By default, it is generated as 'id_task_dddd', where dddd represents random digits.
- title A character representing the title of the XML file associated with the task. By default, it takes the value of the identifier.
- content A list of character content to form the text of the question, which can include HTML tags. For tasks of the Entry type, it must also contain at least one instance of Gap objects, such as TextGap, TextGapOpal, NumericGap, or InlineChoice.
- prompt An optional character representing a simple question text, consisting of one paragraph. This can supplement or replace content in the task. Default is "".
- points A numeric value, optional, representing the number of points for the entire task. Default is 1, but pay attention:
 - For tasks of the Entry type, it is calculated as the sum of the gap points by default.
 - For tasks of the DirectedPair, the default is calculated as 0.5 points per pair.
 - For tasks of the MatchTable type, it can also be calculated as the sum of points for individual answers, when provided.
 - For tasks of the MultipleChoice type, points is numeric vector and required. Each number in this vector determines the number of points that will be awarded to a candidate if they select the corresponding answer. The order of the scores must match the order of the choices. It is possible to assign negative values to incorrect answers. All answers with a positive score are considered correct.
- feedback A list containing feedback messages for candidates. Each element of the list should be an instance of either ModalFeedback, CorrectFeedback, or WrongFeedback class.
- calculator A character, optional, determining whether to show a calculator to the candidate. Possible values:
 - "simple"
 - "scientific"
- files A character vector, optional, containing paths to files that will be accessible to the candidate during the test/exam.
- metadata An object of class QtiMetadata that holds metadata information about the task.
- rows A character vector specifying answer options as row names in the table or the first elements in couples in DirectedPair.

- rows_identifiers A character vector, optional, specifying identifiers for answer options defined in rows of the table or identifiers of the first elements in couples in DirectedPair.
- cols A character vector specifying answer options as column headers in the table or the second elements in couples in DirectedPair.
- cols_identifiers A character vector, optional, specifying identifiers for answer options defined in columns of the table or identifiers of the second elements in couples in DirectedPair.
- answers_identifiers A character vector specifying couples of identifiers that combine the correct answers.
- answers_scores A numeric vector, optional, where each number determines the number of points awarded to a candidate if they select the corresponding answer. If not assigned, the individual values for correct answers are calculated from the task points and the number of correct options.
- shuffle A boolean value, optional, determining whether to randomize the order in which the choices are initially presented to the candidate. Default is TRUE.
- shuffle_rows A boolean value, optional, determining whether to randomize the order of the choices only in rows. Default is TRUE.
- shuffle_cols A boolean value, optional, determining whether to randomize the order of the choices only in columns. Default is TRUE.
- mapping Do not use directly; values are initialized automatically. This slot contains a named numeric vector of points, where names correspond to all possible combinations of row and column identifiers.

Examples

numericGap

Create object NumericGap

Description

Create object NumericGap

numericGap

Usage

```
numericGap(
  solution,
  response_identifier = generate_id(type = "gap"),
  points = 1,
 placeholder = "",
  expected_length = size_gap(solution),
  tolerance = 0,
  tolerance_type = "absolute",
  include_lower_bound = TRUE,
  include_upper_bound = TRUE
)
gapNumeric(
  solution,
  response_identifier = generate_id(type = "gap"),
  points = 1,
 placeholder = "",
  expected_length = size_gap(solution),
  tolerance = 0,
  tolerance_type = "absolute",
  include_lower_bound = TRUE,
  include_upper_bound = TRUE
)
```

Arguments

solution	A numeric value containing the correct answer for this numeric entry.
response_identi	fier
	A character value representing an identifier for the answer. By default, it is generated as 'id_gap_dddd', where dddd represents random digits.
points	A numeric value, optional, representing the number of points for this gap. Default is 1
placeholder	A character value, optional, responsible for placing helpful text in the text input field in the content delivery engine. Default is "".
expected_length	
	A numeric value, optional, responsible for setting the size of the text input field in the content delivery engine. Default value is adjusted by solution size.
tolerance	A numeric value, optional, specifying the value for the upper and lower bound- aries of the tolerance rate for candidate answers. Default is 0.
tolerance_type	A character value, optional, specifying the tolerance mode. Possible values: • "exact"
	 "absolute" - Default. "relative"
include_lower_b	
	A boolean value, optional, specifying whether the lower bound is included in the tolerance rate. Default is TRUE.

include_upper_bound

A boolean value, optional, specifying whether the upper bound is included in the tolerance rate. Default is TRUE.

Value

An object of class NumericGap

See Also

[entry()][textGap()][textGapOpal()]

Examples

NumericGap-class Class "NumericGap"

Description

Class NumericGap is responsible for creating instances of input fields with numeric type of answers in question Entry type assessment tasks according to the QTI 2.1 standard.

Slots

- response_identifier A character value representing an identifier for the answer. By default, it is generated as 'id_gap_dddd', where dddd represents random digits.
- points A numeric value, optional, representing the number of points for this gap. Default is 1.
- placeholder A character value, optional, responsible for placing helpful text in the text input field in the content delivery engine.
- expected_length A numeric value, optional, responsible for setting the size of the text input field in the content delivery engine.
- solution A numeric value containing the correct answer for this numeric entry.
- tolerance A numeric value, optional, specifying the value for the upper and lower boundaries of the tolerance rate for candidate answers. Default is 0.
- tolerance_type A character value, optional, specifying the tolerance mode. Possible values:
 - "exact"

- "absolute" Default.
- "relative"
- include_lower_bound A boolean value, optional, specifying whether the lower bound is included in the tolerance rate. Default is TRUE.
- include_upper_bound A boolean value, optional, specifying whether the upper bound is included in the tolerance rate. Default is TRUE.

See Also

Entry, TextGap, TextGapOpal and InlineChoice.

Examples

```
ng <- new("NumericGap",
            response_identifier = "id_gap_1234",
            points = 1,
            placeholder = "use this format xx.xxx",
            solution = 5,
            tolerance = 1,
            tolerance_type = "relative",
            include_lower_bound = TRUE,
            include_upper_bound = TRUE)
```

oneInColTable Create object OneInColTable

Description

Create object OneInColTable

Usage

```
oneInColTable(
    identifier = generate_id(),
    title = identifier,
    content = list(),
    prompt = "",
    points = 1,
    rows,
    rows_identifiers,
    cols_identifiers,
    answers_identifiers,
    answers_scores = NA_real_,
    shuffle = TRUE,
    shuffle_rows = TRUE,
    shuffle_cols = TRUE,
```

```
feedback = list(),
calculator = NA_character_,
files = NA_character_
)
```

arguments	
identifier	A character representing the unique identifier of the assessment task. By default, it is generated as 'id_task_dddd', where dddd represents random digits.
title	A character representing the title of the XML file associated with the task. By default, it takes the value of the identifier.
content	A character string or a list of character strings to form the text of the question, which may include HTML tags.
prompt	An optional character representing a simple question text, consisting of one paragraph. This can supplement or replace content in the task. Default is "".
points	A numeric value, optional, representing the number of points for the entire task. It can also be calculated as the sum of points for individual answers, when pro- vided. Default is 1.
rows	A character vector specifying answer options defined in rows of the table.
rows_identifi	
	A character vector, optional, specifies identifiers of the rows of the table
cols	A character vector specifying answer options defined in columns of the table.
cols_identifi	
	A character vector, optional, specifies identifiers of the columns of the table.
answers_ident	
	A character vector specifying couples of identifiers that combine the correct answers.
answers_score	s A numeric vector, optional, where each number determines the number of points awarded to a candidate if they select the corresponding answer. If not assigned, the individual values for correct answers are calculated from the task points and the number of correct options.
shuffle	A boolean value, optional, determining whether to randomize the order in which the choices are initially presented to the candidate. Default is TRUE.
shuffle_rows	A boolean value, optional, determining whether to randomize the order of the choices only for the first elements of the answer tuples. Default is TRUE.
shuffle_cols	A boolean value, optional, determining whether to randomize the order of the choices only for the second elements of the answer tuples. Default is TRUE.
feedback	A list containing feedback message-object ModalFeedback for candidates.
calculator	A character, optional, determining whether to show a calculator to the candidate. Possible values:
	"simple""scientific".
6:1	
files	A character vector, optional, containing paths to files that will be accessible to the candidate during the test/exam.

Value

An object of class OneInColTable

Examples

```
ct_min <- oneInColTable(content = "<p>\"One in column table\" task",
                       rows = c("alfa", "beta", "gamma"),
                       rows_identifiers = c("a", "b", "g"),
                       cols = c("A", "B", "G", "a"),
                       cols_identifiers = c("as", "bs", "gs", "aas"),
                       answers_identifiers = c("a as", "b bs", "g gs", "a aas"))
ct <- oneInColTable(identifier = "id_task_1234",</pre>
                   title = "Table with one answer per column",
                   content = "\"One in column table\" task",
                   prompt = "Plain text, can be used instead of the content",
                  rows = c("alfa", "beta", "gamma"),
                   rows_identifiers = c("a", "b", "g"),
                   cols = c("A", "B", "G", "a"),
                   cols_identifiers = c("as", "bs", "gs", "aas"),
                   answers_identifiers = c("a as", "b bs", "g gs", "a aas"),
                   answers_scores = c(1, 0.5, 0.1, 1),
                   shuffle_rows = FALSE,
                   shuffle_cols = TRUE)
```

OneInColTable-class Class "OneInColTable"

Description

Class OneInColTable is responsible for creating assessment tasks according to the QTI 2.1 standard with a table of answer options, where only one correct answer in each column is possible.

Slots

- identifier A character representing the unique identifier of the assessment task. By default, it is generated as 'id_task_dddd', where dddd represents random digits.
- title A character representing the title of the XML file associated with the task. By default, it takes the value of the identifier.
- content A list of character content to form the text of the question, which can include HTML tags. For tasks of the Entry type, it must also contain at least one instance of Gap objects, such as TextGap, TextGapOpal, NumericGap, or InlineChoice.
- prompt An optional character representing a simple question text, consisting of one paragraph. This can supplement or replace content in the task. Default is "".
- points A numeric value, optional, representing the number of points for the entire task. Default is 1, but pay attention:
 - For tasks of the Entry type, it is calculated as the sum of the gap points by default.

- For tasks of the DirectedPair, the default is calculated as 0.5 points per pair.
- For tasks of the MatchTable type, it can also be calculated as the sum of points for individual answers, when provided.
- For tasks of the MultipleChoice type, points is numeric vector and required. Each number in this vector determines the number of points that will be awarded to a candidate if they select the corresponding answer. The order of the scores must match the order of the choices. It is possible to assign negative values to incorrect answers. All answers with a positive score are considered correct.
- feedback A list containing feedback messages for candidates. Each element of the list should be an instance of either ModalFeedback, CorrectFeedback, or WrongFeedback class.
- calculator A character, optional, determining whether to show a calculator to the candidate. Possible values:
 - "simple"
 - "scientific"
- files A character vector, optional, containing paths to files that will be accessible to the candidate during the test/exam.
- metadata An object of class QtiMetadata that holds metadata information about the task.
- rows A character vector specifying answer options as row names in the table or the first elements in couples in DirectedPair.
- rows_identifiers A character vector, optional, specifying identifiers for answer options defined in rows of the table or identifiers of the first elements in couples in DirectedPair.
- cols A character vector specifying answer options as column headers in the table or the second elements in couples in DirectedPair.
- cols_identifiers A character vector, optional, specifying identifiers for answer options defined in columns of the table or identifiers of the second elements in couples in DirectedPair.
- answers_identifiers A character vector specifying couples of identifiers that combine the correct answers.
- answers_scores A numeric vector, optional, where each number determines the number of points awarded to a candidate if they select the corresponding answer. If not assigned, the individual values for correct answers are calculated from the task points and the number of correct options.
- shuffle A boolean value, optional, determining whether to randomize the order in which the choices are initially presented to the candidate. Default is TRUE.
- shuffle_rows A boolean value, optional, determining whether to randomize the order of the choices only in rows. Default is TRUE.
- shuffle_cols A boolean value, optional, determining whether to randomize the order of the choices only in columns. Default is TRUE.

Examples

oneInRowTable

```
"<i>table description</i>"),
points = 5,
rows = c("row1", "row2", "row3", "row4"),
rows_identifiers = c("a", "b", "c", "d"),
cols = c("alfa", "beta", "gamma"),
cols_identifiers = c("k", "l", "m"),
answers_identifiers = c("a k", "d l", 'd m'),
shuffle = TRUE)
```

oneInRowTable Create object OneInRowTable

Description

Create object OneInRowTable

Usage

```
oneInRowTable(
  identifier = generate_id(),
  title = identifier,
  content = list(),
  prompt = "",
  points = 1,
  rows,
  rows_identifiers,
  cols,
  cols_identifiers,
  answers_identifiers,
  answers_scores = NA_real_,
  shuffle = TRUE,
  shuffle_rows = TRUE,
  shuffle_cols = TRUE,
  feedback = list(),
  calculator = NA_character_,
  files = NA_character_
)
```

Arguments

identifier	A character representing the unique identifier of the assessment task. By default, it is generated as 'id_task_dddd', where dddd represents random digits.
title	A character representing the title of the XML file associated with the task. By default, it takes the value of the identifier.
content	A character string or a list of character strings to form the text of the question, which may include HTML tags.

prompt	An optional character representing a simple question text, consisting of one paragraph. This can supplement or replace content in the task. Default is "".
points	A numeric value, optional, representing the number of points for the entire task. It can also be calculated as the sum of points for individual answers, when provided. Default is 1.
rows	A character vector specifying answer options defined in rows of the table.
rows_identifier	S
	A character vector, optional, specifies identifiers of the rows of the table
cols	A character vector specifying answer options defined in columns of the table.
cols_identifier	S
	A character vector, optional, specifies identifiers of the columns of the table.
answers_identif	
	A character vector specifying couples of identifiers that combine the correct answers.
answers_scores	A numeric vector, optional, where each number determines the number of points awarded to a candidate if they select the corresponding answer. If not assigned, the individual values for correct answers are calculated from the task points and the number of correct options.
shuffle	A boolean value, optional, determining whether to randomize the order in which the choices are initially presented to the candidate. Default is TRUE.
shuffle_rows	A boolean value, optional, determining whether to randomize the order of the choices only for the first elements of the answer tuples. Default is TRUE.
shuffle_cols	A boolean value, optional, determining whether to randomize the order of the choices only for the second elements of the answer tuples. Default is TRUE.
feedback	A list containing feedback message-object ModalFeedback for candidates.
calculator	A character, optional, determining whether to show a calculator to the candidate. Possible values:
	• "simple"
	• "scientific".
files	A character vector, optional, containing paths to files that will be accessible to the candidate during the test/exam.

Value

An object of class OneInRowTable

Examples

```
rt_min <- oneInRowTable(content = "<p>\"One in row table\" task",
    rows = c("alfa", "beta", "gamma", "alpha"),
    rows_identifiers = c("a", "b", "g", "aa"),
    cols = c("A", "B", "G"),
    cols_identifiers = c("as", "bs", "gs"),
    answers_identifiers = c("a as", "b bs", "g gs", "aa as"))
```

OneInRowTable-class Class "OneInRowTable"

Description

Class OneInRowTable is responsible for creating assessment tasks according to the QTI 2.1 standard with a table of answer options, where only one correct answer in each row is possible.

Slots

- identifier A character representing the unique identifier of the assessment task. By default, it is generated as 'id_task_dddd', where dddd represents random digits.
- title A character representing the title of the XML file associated with the task. By default, it takes the value of the identifier.
- content A list of character content to form the text of the question, which can include HTML tags. For tasks of the Entry type, it must also contain at least one instance of Gap objects, such as TextGap, TextGapOpal, NumericGap, or InlineChoice.
- prompt An optional character representing a simple question text, consisting of one paragraph. This can supplement or replace content in the task. Default is "".
- points A numeric value, optional, representing the number of points for the entire task. Default is 1, but pay attention:
 - For tasks of the Entry type, it is calculated as the sum of the gap points by default.
 - For tasks of the DirectedPair, the default is calculated as 0.5 points per pair.
 - For tasks of the MatchTable type, it can also be calculated as the sum of points for individual answers, when provided.
 - For tasks of the MultipleChoice type, points is numeric vector and required. Each number in this vector determines the number of points that will be awarded to a candidate if they select the corresponding answer. The order of the scores must match the order of the choices. It is possible to assign negative values to incorrect answers. All answers with a positive score are considered correct.
- feedback A list containing feedback messages for candidates. Each element of the list should be an instance of either ModalFeedback, CorrectFeedback, or WrongFeedback class.

- calculator A character, optional, determining whether to show a calculator to the candidate. Possible values:
 - "simple"
 - "scientific"
- files A character vector, optional, containing paths to files that will be accessible to the candidate during the test/exam.
- metadata An object of class QtiMetadata that holds metadata information about the task.
- rows A character vector specifying answer options as row names in the table or the first elements in couples in DirectedPair.
- rows_identifiers A character vector, optional, specifying identifiers for answer options defined in rows of the table or identifiers of the first elements in couples in DirectedPair.
- cols A character vector specifying answer options as column headers in the table or the second elements in couples in DirectedPair.
- cols_identifiers A character vector, optional, specifying identifiers for answer options defined in columns of the table or identifiers of the second elements in couples in DirectedPair.
- answers_identifiers A character vector specifying couples of identifiers that combine the correct answers.
- answers_scores A numeric vector, optional, where each number determines the number of points awarded to a candidate if they select the corresponding answer. If not assigned, the individual values for correct answers are calculated from the task points and the number of correct options.
- shuffle A boolean value, optional, determining whether to randomize the order in which the choices are initially presented to the candidate. Default is TRUE.
- shuffle_rows A boolean value, optional, determining whether to randomize the order of the choices only in rows. Default is TRUE.
- shuffle_cols A boolean value, optional, determining whether to randomize the order of the choices only in columns. Default is TRUE.

Examples

Opal-class

Class LMS OPAL

Description

Abstract class Opal is represents learning management system.

ordering

Create object Ordering

Description

Create object Ordering

Usage

```
ordering(
  identifier = generate_id(),
  title = identifier,
  choices,
  choices_identifiers = paste0("Choice", LETTERS[seq(choices)]),
  content = list(),
  prompt = "",
  points = 1,
  points_per_answer = TRUE,
  shuffle = TRUE,
  feedback = list(),
  calculator = NA_character_,
  files = NA_character_
)
```

Arguments

identifier	A character representing the unique identifier of the assessment task. By default, it is generated as 'id_task_dddd', where dddd represents random digits.	
title	A character representing the title of the XML file associated with the task. By default, it takes the value of the identifier.	
choices	A character vector containing the answers. The order of answers in the vector represents the correct response for the task.	
choices_identifiers		
	A character vector, optional, containing a set of identifiers for answers. By de- fault, identifiers are generated automatically according to the template "ChoiceD",	
	where D is a letter representing the alphabetical order of the answer in the list.	

content	A character string or a list of character strings to form the text of the question, which may include HTML tags.
prompt	An optional character representing a simple question text, consisting of one paragraph. This can supplement or replace content in the task. Default is "".
points	A numeric value, optional, representing the number of points for the entire task. Default is 1.
<pre>points_per_answ</pre>	er
	A boolean value indicating the scoring method. If TRUE, each selected answer will be scored individually. If FALSE, only fully correct answers will be scored with the maximum score. Default is TRUE.
shuffle	A boolean value indicating whether to randomize the order in which the choices are initially presented to the candidate. Default is TRUE.
feedback	A list containing feedback messages for candidates. Each element of the list should be an instance of either ModalFeedback, CorrectFeedback, or WrongFeedback class.
calculator	A character, optional, determining whether to show a calculator to the candidate. Possible values:
	• "simple"
	• "scientific".
files	A character vector, optional, containing paths to files that will be accessible to the candidate during the test/exam.

Value

An object of class Ordering

Examples

Ordering-class Class "Ordering"

Description

Class Ordering is responsible for creating assessment task according to QTI 2.1., where candidate has to place answers in a specific order

Slots

- identifier A character representing the unique identifier of the assessment task. By default, it is generated as 'id_task_dddd', where dddd represents random digits.
- title A character representing the title of the XML file associated with the task. By default, it takes the value of the identifier.
- content A list of character content to form the text of the question, which can include HTML tags. For tasks of the Entry type, it must also contain at least one instance of Gap objects, such as TextGap, TextGapOpal, NumericGap, or InlineChoice.
- prompt An optional character representing a simple question text, consisting of one paragraph. This can supplement or replace content in the task. Default is "".
- points A numeric value, optional, representing the number of points for the entire task. Default is 1, but pay attention:
 - For tasks of the Entry type, it is calculated as the sum of the gap points by default.
 - For tasks of the DirectedPair, the default is calculated as 0.5 points per pair.
 - For tasks of the MatchTable type, it can also be calculated as the sum of points for individual answers, when provided.
 - For tasks of the MultipleChoice type, points is numeric vector and required. Each number in this vector determines the number of points that will be awarded to a candidate if they select the corresponding answer. The order of the scores must match the order of the choices. It is possible to assign negative values to incorrect answers. All answers with a positive score are considered correct.
- feedback A list containing feedback messages for candidates. Each element of the list should be an instance of either ModalFeedback, CorrectFeedback, or WrongFeedback class.
- calculator A character, optional, determining whether to show a calculator to the candidate. Possible values:
 - "simple"
 - "scientific"
- files A character vector, optional, containing paths to files that will be accessible to the candidate during the test/exam.
- metadata An object of class QtiMetadata that holds metadata information about the task.
- choices A character vector containing the answers. The order of answers in the vector represents the correct response for the task.

- choices_identifiers A character vector, optional, containing a set of identifiers for answers. By default, identifiers are generated automatically. By default, identifiers are generated automatically according to the template "ChoiceL", where L is a letter representing the alphabetical order of the answer in the list.
- shuffle A boolean value indicating whether to randomize the order in which the choices are initially presented to the candidate. Default is TRUE.
- points_per_answer A boolean value indicating the scoring method. If TRUE, each selected answer will be scored individually. If FALSE, only fully correct answers will be scored with the maximum score. Default is TRUE.

Examples

prepareQTIJSFiles-methods

Prepare files to render them with QTIJS

Description

Prepare files to render them with QTIJS

Usage

```
prepareQTIJSFiles(object, dir = NULL)
```

S4 method for signature 'AssessmentItem'
prepareQTIJSFiles(object, dir = "")

S4 method for signature 'AssessmentSection'
prepareQTIJSFiles(object, dir = NULL)

S4 method for signature 'AssessmentTest'
prepareQTIJSFiles(object, dir = NULL)

```
## S4 method for signature 'character'
prepareQTIJSFiles(object, dir = NULL)
```

prepare_renderer

Arguments

object	an instance of AssessmentItem, AssessmentTest, AssessmentTestOpal, AssessmentSection, or string path to xml, rmd or md files
dir	QTIJS path

prepare_renderer Prepare QTIJS renderer

Description

Starts server for QTIJS, returns path of QTIJS and the url of the server.

Usage

prepare_renderer()

publishCourse Publish a course on LMS

Description

Publish a course on LMS

Usage

```
publishCourse(object, course_id)
```

Arguments

object	An S4 object of class LMS that represents a connection to the LMS.
course_id	A character string with course id in the LMS.

Value

Status code of the HTTP request.

publishCourse,Opal-method

Publish a course on LMS Opal

Description

Publish a course on LMS Opal

Usage

S4 method for signature 'Opal'
publishCourse(object, course_id)

Arguments

object	An S4 object of class Opal that represents a connection to the LMS.
course_id	A character string with course id in the LMS.

Value

Status code of the HTTP request.

QtiContributor-class Class QtiContributor

Description

This class stores metadata information about contributors.

Slots

- name A character string representing the name of the author. By default it takes value from environment variable 'RQTI_AUTHOR'.
- role A character string kind of contribution. Possible values: author, publisher, unknown, initiator, terminator, validator, editor, graphical designer, technical implementer, content provider, technical validator, educational validator, script writer, instructional designer, subject matter expert. Default is "author".
- contribution_date A character string representing date of the contribution. Default is the current system date.

qtijs_path

Description

shortcut for the correct QTIJS path

Usage

qtijs_path()

QtiMetadata-class Class QtiMetadata

Description

This class stores metadata information such as contributors, description, rights and version for QTIcompliant tasks or tests.

Slots

- contributor A list of objects QtiContributor-type that holds metadata information about the authors.
- description A character string providing a textual description of the content of this learning object.
- rights A character string describing the intellectual property rights and conditions of use for this learning object. By default it takes value from environment variable 'RQTI_RIGHTS'.
- version A character string representing the edition/version of this learning object.

qti_contributor Constructor function for class QtiContributor

Description

Creates object of QtiContributor-class

Usage

```
qti_contributor(
   name = Sys.getenv("RQTI_AUTHOR"),
   role = "author",
   contribution_date = ifelse(name != "", Sys.Date(), NA_Date_)
)
```

Arguments

name	A character string representing the name of the author.	
role	A character string kind of contribution. Possible values: author, publisher,	
	unknown, initiator, terminator, validator, editor, graphical designer, technical	
	implementer, content provider, technical validator, educational validator, script	
	writer, instructional designer, subject matter expert. Default is "author".	
contribution_date		
	A character string representing date of the contribution. Default is the current system date, when contributor is assigned.	

Examples

creator= qti_contributor("Max Mustermann", "technical validator")

qti_metadata	Constructor function for class QtiMetadata
--------------	--

Description

Creates object of QtiMetadata-class

Usage

```
qti_metadata(
   contributor = list(),
   description = "",
   rights = Sys.getenv("RQTI_RIGHTS"),
   version = NA_character_
)
```

Arguments

contributor	A list of objects QtiContributor-type that holds metadata information about the authors.
description	A character string providing a textual description of the content of this learning object.
rights	A character string describing the intellectual property rights and conditions of use for this learning object. By default it takes value from environment variable 'RQTI_RIGHTS'.
version	A character string representing the edition/version of this learning object.

Examples

render_opal

Description

Render Rmd directly in Opal via API

Usage

```
render_opal(input, ...)
```

Arguments

input	(the path to the input Rmd document)
	required for passing arguments when knitting

Details

Customize knit function in the Rmd file using the following YAML setting after the word knit knit: rqti::render_opal.

Value

A list with the key, display name, and URL of the resource in Opal.

Examples

```
file <- system.file("exercises/sc1.Rmd", package='rqti')
render_opal(file)</pre>
```

render_qtijs

Render an RMD/xml file or rqti-object as qti xml with QTIJS

Description

Generates the qti xml file via rmd2xml. The xml is copied into the QTIJS folder of the package which transforms the xml into HTML. Finally, the HTML is displayed and the user can have a preview of the exercise or exam.

Usage

```
render_qtijs(input, preview_feedback = FALSE, ...)
```

Arguments

input	(the path to the input Rmd/md/xml document or AssessmentItem, AssessmentTest,	
	AssessmentTestOpal, AssessmentSection object)	
preview_feedback		
	A boolean value; optional. Set TRUE value to always display a model feedback (for example, as a model answer). Default is FALSE.	
	required for passing arguments when knitting	

Details

Requires a running QTIJS server, which can be started with start_server(). When loading the package rqti, a server is started automatically.

The preview is automatically loaded into the RStudio viewer. Alternatively you can just open the browser in the corresponding local server which is displayed when rendering. Since the function is supposed to be called via the Knit-Button in RStudio, it defaults to the RStudio viewer pane.

Customize knit function in the Rmd file using the following YAML setting after the word knit knit: rqti::render_qtijs.

Value

An URL of the corresponding local server to display the rendering result.

Examples

```
file <- system.file("exercises/sc1.Rmd", package='rqti')
render_qtijs(file)</pre>
```

render_xml

Render a single xml file with QTIJS

Description

Uses QTIJS to render a single xml file in the RStudio viewer pane with a local server.

Usage

```
render_xml(input)
```

Arguments

input input file

Value

nothing, has side effects

render_zip

Description

Uses QTIJS to render a zipped qti archive in the RStudio viewer pane with a local server.

Usage

```
render_zip(input)
```

Arguments

input input file

Value

nothing, has side effects

```
rmd2xml
```

Create qti-XML task file from Rmd (md) description

Description

Create XML file for question specification from Rmd (md) description according to qti 2.1 infromation model

Usage

rmd2xml(file, path = getwd(), verification = FALSE)

Arguments

file	A string of path to file with markdown description of question.
path	A string, optional; a folder to store xml file. Default is working directory.
verification	A boolean value, optional; enable validation of the xml file. Default is FALSE.

Value

The path string to the xml file.

Examples

```
## Not run:
# creates folder with xml (side effect)
rmd2xml("task.Rmd", "target_folder", TRUE)
```

End(Not run)

rmd2zip

Description

Create zip file with test, that contains one xml question specification generated from Rmd (md) description according to qti 2.1 information model

Usage

rmd2zip(file, path = getwd(), verification = FALSE)

Arguments

file	A string of path to file with markdown description of question.
path	A string, optional; a folder to store xml file. Default is working directory.
verification	A boolean value, optional; enable validation of the xml file. Default is FALSE.

Value

The path string to the zip file.

Examples

```
## Not run:
# creates folder with zip (side effect)
rmd2zip("task.Rmd", "target_folder", TRUE)
```

```
## End(Not run)
```

```
section
```

Create a section as part of a test content

Description

Create an AssessmentSection rqti-object as part of a test content

Usage

```
section(
   content,
   n_variants = 1L,
   seed_number = NULL,
   id = NULL,
   by = "variants",
   selection = NULL,
```

section

```
title = character(0),
time_limits = NA_integer_,
visible = TRUE,
shuffle = FALSE,
max_attempts = NA_integer_,
allow_comment = TRUE
```

Arguments

content	A character vector of Rmd, md, xml files, task- or section-objects.
n_variants	An integer value indicating the number of task variants to create from Rmd files. Default is 1.
seed_number	An integer vector, optional, specifying seed numbers to reproduce the result of calculations.
id	A character value, optional, serving as the identifier of the assessment section.
by	A character with two possible values: "variants" or "files", indicating the type of the test structure. Default is "variants".
selection	An integer value, optional, defining how many children of the section are delivered in the test. Default is NULL, meaning "no selection".
title	A character value, optional, representing the title of the section. If not provided, it defaults to identifier.
time_limits	An integer value, optional, controlling the amount of time a candidate is allowed for this part of the test.
visible	A boolean value, optional, indicating whether the title of this section is shown in the hierarchy of the test structure. Default is TRUE.
shuffle	A boolean value, optional, responsible for randomizing the order in which the assessment items and subsections are initially presented to the candidate. Default is FALSE.
<pre>max_attempts</pre>	An integer value, optional, enabling the maximum number of attempts allowed for a candidate to pass this section.
allow_comment	A boolean value, optional, enabling candidates to leave comments on each question of the section. Default is TRUE.

Value

An object of class AssessmentSection.

See Also

test(), test4opal()

Examples

```
sc <- new("SingleChoice", prompt = "Question", choices = c("A", "B", "C"))
es <- new("Essay", prompt = "Question")
# Since ready-made S4 "AssessmentItem" objects are taken, in this example a
#permanent section consisting of two tasks is created.
s <- section(c(sc, es), title = "Section with nonrandomized tasks")
# Since Rmd files with randomization of internal variables are taken,
#in this example 2 variants are created with a different seed number for each.
path <- system.file("rmarkdown/templates/", package='rqti')
file1 <- file.path(path, "singlechoice-simple/skeleton/skeleton.Rmd")
file2 <- file.path(path, "singlechoice-complex/skeleton/skeleton.Rmd")
s <- section(c(file1, file2), n_variants = 2,
title = "Section with two variants of tasks")</pre>
```

singleChoice Create object SingleChoice

Description

Create object SingleChoice

Usage

```
singleChoice(
    identifier = generate_id(),
    title = identifier,
    choices,
    choice_identifiers = paste0("Choice", LETTERS[seq(choices)]),
    solution = 1,
    content = list(),
    prompt = "",
    points = 1,
    feedback = list(),
    orientation = "vertical",
    shuffle = TRUE,
    calculator = NA_character_,
    files = NA_character_
```

Arguments

identifier	A character representing the unique identifier of the assessment task. By default, it is generated as 'id_task_dddd', where dddd represents random digits.
title	A character representing the title of the XML file associated with the task. By default, it takes the value of the identifier.
choices	A character vector defining a set of answer options in the question.

92

choice_identifiers

enorce_racheri	
	A character vector, optional, containing a set of identifiers for answers. By de- fault, identifiers are generated automatically according to the template "ChoiceD", where D is a letter representing the alphabetical order of the answer in the list.
solution	A numeric value, optional. Represents the index of the correct answer in the choices slot. By default, the first item in the choices slot is considered the correct answer. Default is 1.
content	A character string or a list of character strings to form the text of the question, which may include HTML tags.
prompt	An optional character representing a simple question text, consisting of one paragraph. This can supplement or replace content in the task. Default is "".
points	A numeric value, optional, representing the number of points for the entire task. Default is 1.
feedback	A list containing feedback messages for candidates. Each element of the list should be an instance of either ModalFeedback, CorrectFeedback, or WrongFeedback class.
orientation	A character, determining whether to place answers in vertical or horizontal mode. Possible values:
	 "vertical" - Default, "horizontal".
shuffle	A boolean value indicating whether to randomize the order in which the choices are initially presented to the candidate. Default is TRUE.
calculator	A character, optional, determining whether to show a calculator to the candidate. Possible values:
	 "simple" "scientific".
files	A character vector, optional, containing paths to files that will be accessible to the candidate during the test/exam.

Value

An object of class SingleChoice

Examples

```
files = "text_book.pdf",
choices = c("option 1", "option 2", "option 3"),
choice_identifiers = c("ChoiceA", "ChoiceB", "ChoiceC"),
shuffle = TRUE,
orientation = "vertical",
solution = 2)
```

SingleChoice-class Class "SingleChoice"

Description

Class SingleChoice is responsible for creating single-choice assessment tasks according to the QTI 2.1 standard.

Slots

- identifier A character representing the unique identifier of the assessment task. By default, it is generated as 'id_task_dddd', where dddd represents random digits.
- title A character representing the title of the XML file associated with the task. By default, it takes the value of the identifier.
- content A list of character content to form the text of the question, which can include HTML tags. For tasks of the Entry type, it must also contain at least one instance of Gap objects, such as TextGap, TextGapOpal, NumericGap, or InlineChoice.
- prompt An optional character representing a simple question text, consisting of one paragraph. This can supplement or replace content in the task. Default is "".
- points A numeric value, optional, representing the number of points for the entire task. Default is 1, but pay attention:
 - For tasks of the Entry type, it is calculated as the sum of the gap points by default.
 - For tasks of the DirectedPair, the default is calculated as 0.5 points per pair.
 - For tasks of the MatchTable type, it can also be calculated as the sum of points for individual answers, when provided.
 - For tasks of the MultipleChoice type, points is numeric vector and required. Each number in this vector determines the number of points that will be awarded to a candidate if they select the corresponding answer. The order of the scores must match the order of the choices. It is possible to assign negative values to incorrect answers. All answers with a positive score are considered correct.
- feedback A list containing feedback messages for candidates. Each element of the list should be an instance of either ModalFeedback, CorrectFeedback, or WrongFeedback class.
- calculator A character, optional, determining whether to show a calculator to the candidate. Possible values:
 - "simple"
 - "scientific"

- files A character vector, optional, containing paths to files that will be accessible to the candidate during the test/exam.
- metadata An object of class QtiMetadata that holds metadata information about the task.
- choices A character vector defining a set of answer options in the question.
- choice_identifiers A character vector, optional, containing a set of identifiers for answers. By default, identifiers are generated automatically according to the template "ChoiceD", where D is a letter representing the alphabetical order of the answer in the list.
- shuffle A boolean value indicating whether to randomize the order in which the choices are initially presented to the candidate. Default is TRUE.
- orientation A character, determining whether to place answers in vertical or horizontal mode. Possible values:
 - "vertical" Default.
 - "horizontal"
- solution A numeric value, optional. Represents the index of the correct answer in the choices slot. By default, the first item in the choices slot is considered the correct answer. Default is 1.

Examples

start_server Start QTIJS on a local server

Description

This function starts an http server with the QTIJS renderer. The renderer performs the conversion of qti.xml into HTML.

Usage

start_server()

Details

The server has to be started manually by the user, otherwise the Knit Button will not work. The Button starts a new session and invoking a server there does not make much sense.

Value

The URL string for QTIJS server.

Examples

```
## Not run:
# Initiated server in qtiViewer folder
start_server()
# Initiated server in a specific folder provided by the user. This folder
# contains the QTI renderer
start_server("/pathToTheQtiRenderer/")
```

End(Not run)

stop_server

Stop QTIJS local server

Description

Stop QTIJS local server

Usage

stop_server()

Value

nothing, has side effects

test

Create a test

Description

Create an AssessmentTest rqti-object.

Usage

```
test(
  content,
  identifier = "test_identifier",
  title = "Test Title",
  time_limit = 90L,
 max_attempts = 1L,
  academic_grading = FALSE,
  grade_label = c(en = "Grade", de = "Note"),
  table_label = c(en = "Grade", de = "Note"),
  navigation_mode = "nonlinear",
  submission_mode = "individual",
  allow_comment = TRUE,
  rebuild_variables = TRUE,
  contributor = list(),
  description = "",
  rights = Sys.getenv("RQTI_RIGHTS"),
  version = "0.0.9"
)
```

Arguments

content	A list containing AssessmentSection objects.	
identifier	A character value indicating the identifier of the test file. Default is 'test_identifier'.	
title	A character value, optional, representing the file title. Default is 'Test Title'.	
time_limit	An integer value, optional, controlling the time given to a candidate for the test in minutes. Default is 90 minutes.	
<pre>max_attempts</pre>	An integer value, optional, indicating the maximum number of attempts allowed for the candidate. Default is 1.	
academic_gradi	ng	
	A boolean, optional; enables showing a grade to the candidate at the end of the testing according to the 5-point academic grade system as feedback. Default is FALSE.	
grade_label	A character value, optional; a short message that shows with a grade in the final feedback; for multilingual use, it can be a named vector with two-letter ISO language codes as names (e.g., c(en="Grade", de="Note")); during test creation, it takes the value for the language of the operating system; c(en="Grade", de="Note") is default.	
table_label	A character value, optional; a concise message to display as the column ti- tle of the grading table in the final feedback; for multilingual use, it can be a named vector with two-letter ISO language codes as names (e.g., c(en="Grade", de="Note")); during test creation, it takes the value for the language of the op- erating system; c(en="Grade", de="Note")is default.	
navigation_mode		
-	A character value, optional, determining the general paths that the candidate may have during the exam. Two mode options are possible: - 'linear': Candidate	

test

	is not allowed to return to previous questions 'nonlinear': Candidate is free to navigate; used by default.
submission_mode	2
	A character value, optional, determining when the candidate's responses are submitted for response processing. One of two mode options is possible: - 'individual': Submit candidates' responses on an item-by-item basis; used by default 'simultaneous': Candidates' responses are submitted all together by the end of the test.
allow_comment	A boolean, optional, enabling the candidate to leave comments in each question. Default is TRUE.
rebuild_variab	les
	A boolean, optional, enabling the recalculation of variables and reshuffling the order of choices for each item-attempt. Default is TRUE.
contributor	A list of objects QtiContributor-type that holds metadata information about the authors.
description	A character string providing a textual description of the content of this learning object.
rights	A character string describing the intellectual property rights and conditions of use for this learning object. By default it takes value from environment variable 'RQTI_RIGHTS'.
version	A character string representing the edition/version of this learning object.

Value

An AssessmentTest object.

See Also

test4opal(), section(), AssessmentTest, AssessmentSection

Examples

```
sc <- new("SingleChoice", prompt = "Question", choices = c("A", "B", "C"))
es <- new("Essay", prompt = "Question")
s <- section(c(sc, es), title = "Section with nonrandomized tasks")
t <- test(s, title = "Example of the Exam", academic_grading = TRUE)</pre>
```

test4opal

Create a test for LMS OPAL

Description

Create an AssessmentTestOpal rqti-object.

test4opal

Usage

```
test4opal(
  content,
  identifier = "test_identifier",
  title = "Test Title",
  time_limit = 90L,
  max_attempts = 1L,
  files = NULL,
  calculator = NULL,
  academic_grading = FALSE,
  grade_label = c(en = "Grade", de = "Note"),
table_label = c(en = "Grade", de = "Note"),
  navigation_mode = "nonlinear",
  submission_mode = "individual",
  allow_comment = TRUE,
  rebuild_variables = TRUE,
  show_test_time = TRUE,
  mark_items = TRUE,
  keep_responses = FALSE,
  contributor = list(),
  description = "",
  rights = Sys.getenv("RQTI_RIGHTS"),
  version = "0.0.9"
)
```

Arguments

content	A list containing AssessmentSection objects.	
identifier	A character value indicating the identifier of the test file. Default is 'test_identifier'.	
title	A character value, optional, representing the file title. Default is 'Test Title'.	
time_limit	An integer value, optional, controlling the time given to a candidate for the test in minutes. Default is 90 minutes.	
<pre>max_attempts</pre>	An integer value, optional, indicating the maximum number of attempts allowed for the candidate. Default is 1.	
files	A character vector, optional; paths to files that will be accessible to the candidate during the test/exam.	
calculator	A character, optional; determines whether to show a calculator to the candidate. Possible values:	
	• 'simple'	
	• 'scientific'. Default is NULL.	
academic_grading		
	A boolean, optional; enables to show to candidate at the end of the testing a grade according to 5-point academic grade system as a feedback; Default is FALSE.	
grade_label	A character value, optional; a short message that shows with a grade in the final feedback; for multilingual use, it can be a named vector with two-letter	

	ISO language codes as names (e.g., c(en="Grade", de="Note")); during test cre- ation, it takes the value for the language of the operating system; c(en="Grade", de="Note")is default.
table_label	A character value, optional; a concise message to display as the column ti- tle of the grading table in the final feedback; for multilingual use, it can be a named vector with two-letter ISO language codes as names (e.g., c(en="Grade", de="Note")); during test creation, it takes the value for the language of the op- erating system; c(en="Grade", de="Note")is default.
navigation_mode	2
	A character value, optional, determining the general paths that the candidate may have during the exam. Two mode options are possible: - 'linear': Candidate is not allowed to return to previous questions 'nonlinear': Candidate is free to navigate; used by default.
submission_mode	
	A character value, optional, determining when the candidate's responses are submitted for response processing. One of two mode options is possible: - 'individual': Submit candidates' responses on an item-by-item basis; used by default 'simultaneous': Candidates' responses are submitted all together by the end of the test.
allow_comment	A boolean, optional, enabling the candidate to leave comments in each question. Default is TRUE.
rebuild_variabl	es
	A boolean, optional, enabling the recalculation of variables and reshuffling the order of choices for each item-attempt. Default is TRUE.
<pre>show_test_time</pre>	A boolean, optional, determining whether to show candidate elapsed processing time without a time limit. Default is TRUE.
<pre>mark_items</pre>	A boolean, optional, determining whether to allow candidate marking of questions. Default is TRUE.
keep_responses	A boolean, optional, determining whether to save the candidate's answers from the previous attempt. Default is FALSE.
contributor	A list of objects QtiContributor-type that holds metadata information about the authors.
description	A character string providing a textual description of the content of this learning object.
rights	A character string describing the intellectual property rights and conditions of use for this learning object. By default it takes value from environment variable 'RQTI_RIGHTS'.
version	A character string representing the edition/version of this learning object.

Value

An AssessmentTestOpal object

See Also

test(), section(), AssessmentTestOpal, AssessmentSection

textGap

Examples

```
sc <- new("SingleChoice", prompt = "Question", choices = c("A", "B", "C"))
es <- new("Essay", prompt = "Question")
s <- section(c(sc, es), title = "Section with nonrandomized tasks")
t <- test4opal(s, title = "Example of the Exam", academic_grading = TRUE,
show_test_time = FALSE)</pre>
```

```
textGap
```

Create object TextGap

Description

Create object TextGap

Usage

```
textGap(
  solution,
  response_identifier = generate_id(type = "gap"),
  points = 1,
  placeholder = "",
  expected_length = size_gap(solution),
  case_sensitive = FALSE
)
gapText(
  solution,
  response_identifier = generate_id(type = "gap"),
  points = 1,
  placeholder = "",
  expected_length = size_gap(solution),
  case_sensitive = FALSE
)
```

Arguments

solution	A character vector containing the values considered as correct answers.	
response_identifier		
	A character value representing an identifier for the answer. By default, it is generated as 'id_gap_dddd', where dddd represents random digits.	
points	A numeric value, optional, representing the number of points for this gap. Default is 1	
placeholder	A character value, optional, responsible for placing helpful text in the text input field in the content delivery engine. Default is "".	
expected_length		
	A numeric value, optional, responsible for setting the size of the text input field in the content delivery engine. Default value is adjusted by solution size.	

case_sensitive A boolean value, determining whether the evaluation of the correct answer is case sensitive. Default is FALSE.

Value

An object of class TextGap

See Also

[entry()][numericGap()][textGapOpal()]

Examples

TextGap-class Class "TextGap"

Description

Class TextGap is responsible for creating instances of input fields with text type of answers in question Entry type assessment tasks according to the QTI 2.1 standard.

Slots

- response_identifier A character value representing an identifier for the answer. By default, it is generated as 'id_gap_dddd', where dddd represents random digits.
- points A numeric value, optional, representing the number of points for this gap. Default is 1.
- placeholder A character value, optional, responsible for placing helpful text in the text input field in the content delivery engine.
- expected_length A numeric value, optional, responsible for setting the size of the text input field in the content delivery engine.
- solution A character vector containing the values considered as correct answers.
- case_sensitive A boolean value, determining whether the evaluation of the correct answer is case sensitive. Default is FALSE.

textGapOpal

Examples

```
tg <- new("TextGap",
            response_identifier = "id_gap_1234",
            points = 2,
            placeholder = "do not put special characters",
            expected_length = 20,
            solution = c("answer", "answerr", "aanswer"),
            case_sensitive = FALSE)
```

textGapOpal Create object TextGapOpal

Description

Create object TextGapOpal

Usage

```
textGapOpal(
  solution,
  response_identifier = generate_id(type = "gap"),
 points = 1,
 placeholder = "",
 expected_length = size_gap(solution),
 case_sensitive = FALSE,
  tolerance = 0
)
gapTextOpal(
  solution,
  response_identifier = generate_id(type = "gap"),
 points = 1,
 placeholder = "",
  expected_length = size_gap(solution),
  case_sensitive = FALSE,
  tolerance = 0
)
```

Arguments

 solution
 A character vector containing the values considered as correct answers.

 response_identifier
 A character value representing an identifier for the answer. By default, it is generated as 'id_gap_dddd', where dddd represents random digits.

 points
 A numeric value, optional, representing the number of points for this gap. Default is 1

placeholder	A character value, optional, responsible for placing helpful text in the text input
	field in the content delivery engine. Default is "".
expected_length	
	A numeric value, optional, responsible for setting the size of the text input field in the content delivery engine. Default value is adjusted by solution size.
case_sensitive	A boolean value, determining whether the evaluation of the correct answer is case sensitive. Default is FALSE.
tolerance	A numeric value defining how many characters will be taken into account to tolerate spelling mistakes in the evaluation of candidate answers. Default is 0.

Value

An object of class TextGapOpal

See Also

[entry()][numericGap()][textGap()]

Examples

```
tgo_min <- textGapOpal("answer")</pre>
```

```
tgo <- textGapOpal(solution = "answer",
    response_identifier = "id_gap_1234",
    points = 2,
    placeholder = "put your answer here",
    expected_length = 20,
    case_sensitive = TRUE,
    tolerance = 2)
```

TextGapOpal-class Class "TextGapOpal"

Description

Class TextGapOpal is responsible for creating instances of input fields with text type of answers in question Entry type assessment tasks according to the QTI 2.1 standard for LMS Opal.

Slots

- response_identifier A character value representing an identifier for the answer. By default, it is generated as 'id_gap_dddd', where dddd represents random digits.
- points A numeric value, optional, representing the number of points for this gap. Default is 1.
- placeholder A character value, optional, responsible for placing helpful text in the text input field in the content delivery engine.
- expected_length A numeric value, optional, responsible for setting the size of the text input field in the content delivery engine.

solution A character vector containing the values considered as correct answers.

- case_sensitive A boolean value, determining whether the evaluation of the correct answer is case sensitive. Default is FALSE.
- tolerance A numeric value defining how many characters will be taken into account to tolerate spelling mistakes in the evaluation of candidate answers. Default is 0.

See Also

Entry, NumericGap, TextGap and InlineChoice.

Examples

```
updateCourseElementResource
```

Update the referenced learning resource of a course element in the LMS

Description

Update the referenced learning resource of a course element in the LMS

Usage

```
updateCourseElementResource(object, course_id, ...)
```

Arguments

object	An S4 object of class LMS that represents a connection to the LMS.
course_id	A character string with course id in the LMS.
	Additional arguments to be passed to the method, if applicable.

Value

Response of the HTTP request.

updateCourseElementResource,Opal-method

Update the referenced learning resource of a course element in the LMS Opal

Description

Update the referenced learning resource of a course element in the LMS Opal

Usage

```
## S4 method for signature 'Opal'
updateCourseElementResource(
   object,
   course_id,
   node_id,
   resource_id,
   publish = TRUE
)
```

Arguments

object	An S4 object of class LMS that represents a connection to the LMS.
course_id	A character string with the course ID. You can find this in the course's details (Resource ID) in the LMS.
node_id	A character string with the course element ID. This can be found, for example, in the course editor under the "Title and Description" tab of the respective course element in the LMS Opal.
resource_id	A character string wiht the ID of the resource. This can be found in the details view of the desired resource within the LMS.
publish	A boolean value that determines whether the course should be published after the resource is updated. If TRUE (default), the course will be published immedi- ately after the update. If FALSE, the course will not be published automatically, leaving it in an unpublished state until manual publication.

Value

The response of the HTTP request made to update the resource. If the course is published, an additional message about the publishing status is returned.

upload2LMS

Description

This is a generic function that handles the process of uploading content to a Learning Management System (LMS). The content can be in the form of an AssessmentTest, AssessmentTestOpal, AssessmentItem object, or a file in Rmd, Markdown, zip or XML format.

This is a generic function that handles the process of uploading content to LMS Opal. The content can be in the form of an AssessmentTest, AssessmentTestOpal, AssessmentItem object, or a file in Rmd, Markdown, zip or XML format.

Usage

```
upload2LMS(object, test, ...)
## S4 method for signature 'Opal'
upload2LMS(
   object,
   test,
   display_name = NULL,
   access = 4,
   overwrite = TRUE,
   open_in_browser = TRUE,
   as_survey = FALSE
)
```

Arguments

object	An S4 object representing the LMS, such as an instance of the Opal class.
test	An AssessmentTest, AssessmentTestOpal or AssessmentItem objects, or a character string with path to Rmd/md, zip or XML files.
	Additional arguments to be passed to the method, if applicable.
display_name	A length one character vector to entitle resource in OPAL; file name without extension or identifier of the object by default; optional.
access	An integer value, optional; it is responsible for publication status, where 1 - only those responsible for this learning resource; 2 - responsible and other authors; 3 - all registered users; 4 - registered users and guests. Default is 4.
overwrite	A boolean value. If TRUE, and a file with the specified display name already exists, it will be overwritten. Default is TRUE.
open_in_browser	
	A boolean value; optional; it controls whether to open a URL in default browser. Default is TRUE .
as_survey	A boolean value, optional. If TRUE, the resource will be treated as a survey; if FALSE, as a test. Default is FALSE.

verify_qti

Description

This function validates a QTI XML document against the IMS QTI v2.1.2 XSD schema.

Usage

```
verify_qti(doc, extended_scheme = FALSE)
```

Arguments

doc

A character string representing the path to the XML file or an xml2 document object.

extended_scheme

A boolean value that controls the version of the XSD schema used for validation. If TRUE, the extended version is used, allowing additional tags in the XML (e.g., details). Default is FALSE.

Value

A logical value indicating whether the XML document is valid according to the schema. If invalid, returns an object detailing the validation errors.

Examples

```
## Not run:
# Validate an XML file
result <- verify_qti("path/to/your/qti.xml")</pre>
```

End(Not run)

wrongFeedback Create object WrongFeedback

Description

Create object WrongFeedback

Usage

```
wrongFeedback(content = list(), title = character(0), show = TRUE)
```

Arguments

content	A character string or a list of character strings to form the text of the question, which may include HTML tags.
title	A character value, optional, representing the title of the feedback window.
show	A boolean value, optional, determining whether to show (TRUE) or hide (FALSE) the feedback. Default is TRUE.

Value

An object of class WrongFeedback

Examples

```
wfb <- wrongFeedback(content = "Some comments", title = "Feedback")</pre>
```

WrongFeedback-class Class "WrongFeedback"

Description

Class WrongFeedback is responsible for delivering feedback messages to the candidate in case of an incorrect answer on the entire exercise.

Slots

- outcome_identifier A character representing the unique identifier of the outcome declaration variable that relates to feedback. Default is "FEEDBACKMODAL".
- show A boolean value, optional, determining whether to show (TRUE) or hide (FALSE) the modal feedback. Default is TRUE.
- title A character value, optional, representing the title of the modal feedback window.
- content A list of character content to form the text of the modal feedback, which can include HTML tags.
- identifier A character value representing the identifier of the modal feedback item. Default is "incorrect".
